Text S1

The GBS-based SNPs identified from *desi* chickpea consisted of 12112 and 26399 reference genome- and *de novo*-based SNPs, respectively. The reference genome-based SNPs included 4672 SNPs that were physically mapped on eight *desi* chromosomes with an average map density of 26.6 kb (**Table S3, Fig. S2A**). The remaining 7440 SNPs were physically mapped on *desi* genome scaffolds. The average SNP map density was highest on *desi* chromosome 6 (22.2 kb) and lowest on chromosome 5 (35.9 kb). A higher proportion of SNPs were physically mapped on *desi* chromosome 4 (19.9%, 930 SNPs) (**Table S3**).

Text S2

The structural annotation of 12112 *desi* reference genome-based SNPs identified 5071 (41.9%) SNPs in the intergenic regions and 7041 (58.1%) SNPs in 2827 genes (**Fig. S2B**). The number of SNPs detected in the *desi* genes ranged from 1 to 6, with a mean of 2.5 SNPs/gene. The detailed annotation of SNPs in diverse sequence components of genes showed the occurrence of a maximum proportion (44.4%, 3123 SNPs) of SNPs in the exons (CDS), followed by introns (35.9%, 2531) and 1000-bp downstream regulatory regions (DRRs) (12.8%, 900) and a minimum (6.9%, 487) in the 2000-bp upstream regulatory regions (URRs) (**Fig. S2B**). The coding SNPs included 1838 (58.9%) SNPs within 894 genes revealed synonymous substitutions, while 1285 (41.1%) SNPs in 878 genes showed non-synonymous substitutions. The non-synonymous SNPs comprised of 1258 (97.9%) missense SNPs in 864 genes and 27 (2.1%) nonsense SNPs in 26 genes (**Fig. S2B**). The KOG-based functional annotation (excluding unknown and general functions) of *desi* genes with SNPs showed their primary roles in signal transduction mechanisms (15.9% 13.7%), followed by transcription (11.8%) (**Fig. S3A**).

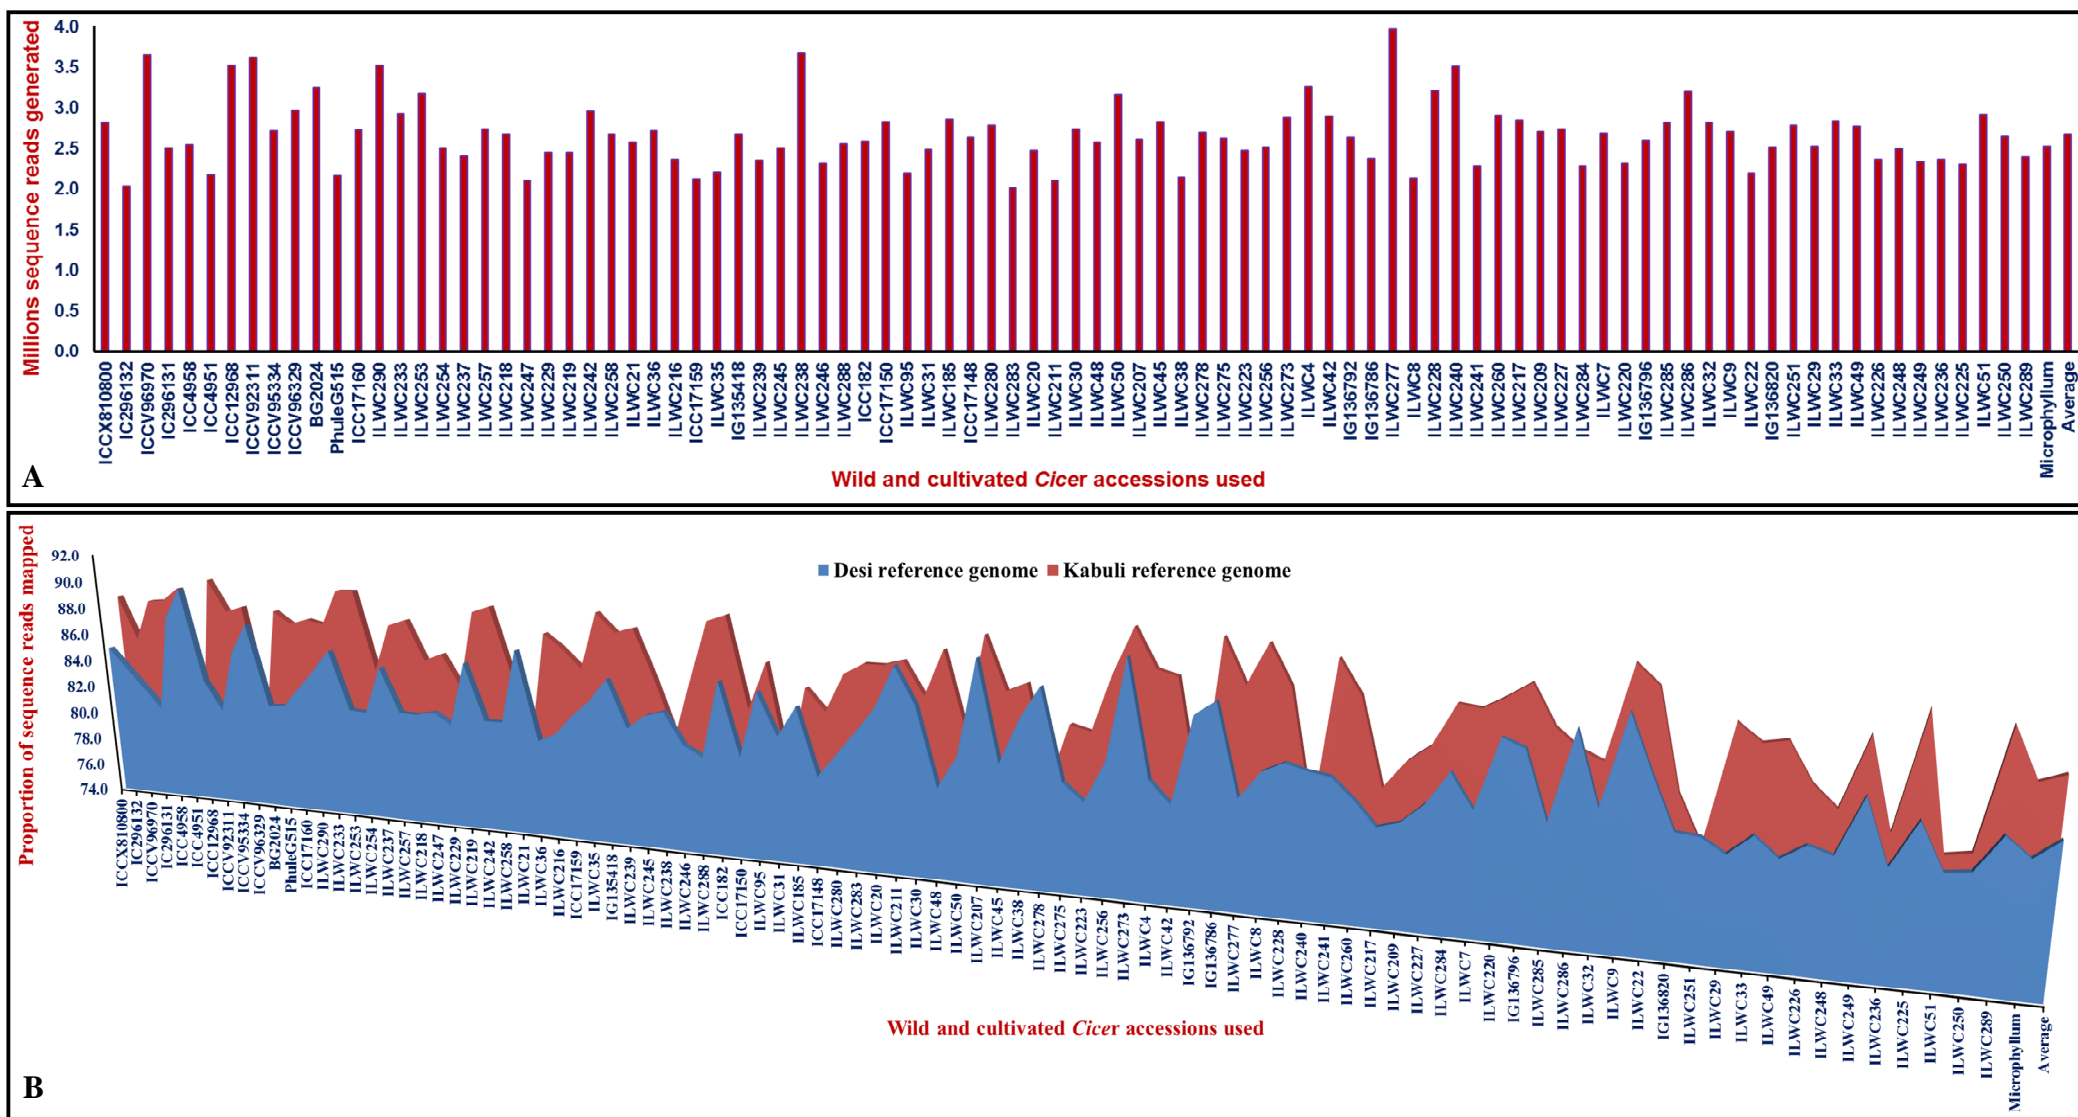

Fig. S1: (A) Frequency distribution of millions sequence reads generated from each of the 93 wild and cultivated *Cicer* accessions using a 96-plex GBS assay and proportion of these sequence reads mapped on *desi* and *kabuli* reference genomes (B).

Fig. S2: The distribution of 4672 GBS-based genome-wide SNPs physically mapped on eight *desi* chickpea chromosomes are illustrated in the Circos circular ideogram (A). The outermost and innermost circles represent the different colours-coded chromosomes and distribution of SNPs, including non-synonymous SNPs (marked with red dots), respectively. (B) Frequency distribution of 12112 GBS-based SNPs mined in the intergenic regions and diverse coding and non-coding sequence components of 2827 genes annotated from *desi* genome. Number and proportion of SNPs, including synonymous and non-synonymous SNPs annotated in the coding as well as non-coding intronic and regulatory sequences of *desi* chickpea genes and intergenic regions are depicted. The URR (upstream regulatory region) and DRR (downstream regulatory region) of genes were defined as per the gene annotation information of *desi* genome (Jain et al.²²).

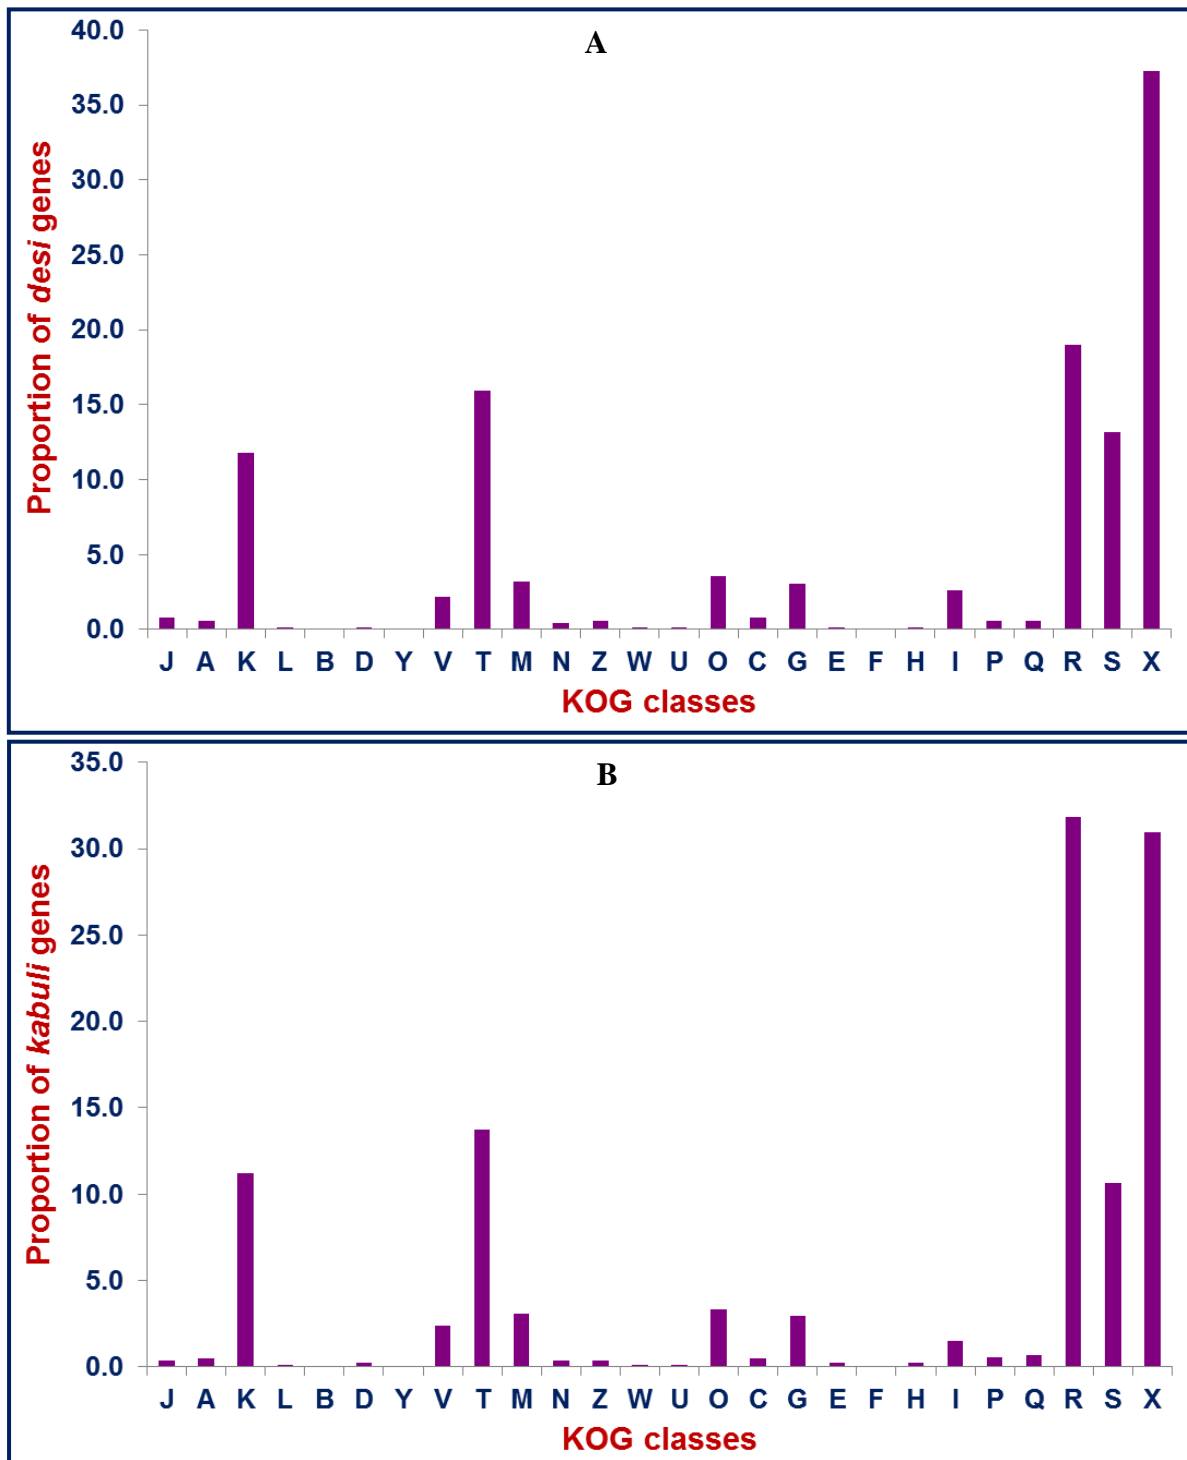

Fig. S3: KOG-based putative function determination of SNPs-carrying *desi* (A) and *kabuli* (B) genes. The diverse KOG classes are defined as J: Translation, ribosomal structure and biogenesis, A: RNA processing and modification, K: Transcription, L: Replication, recombination and repair, D: Cell cycle control, cell division and chromosome partitioning, Y: Nuclear structure, V: Defence mechanisms, T: Signal transduction mechanisms, M: Cell wall/membrane/envelope biogenesis, N: Cell motility, Z: Cytoskeleton, W: Extracellular structures, O: Posttranslational modification, protein turnover and chaperones, C: Energy production and conversion, G: Carbohydrate transport and metabolism, E: Amino acid transport and metabolism, H: Coenzyme transport and metabolism, I: Lipid transport and metabolism, P: Inorganic ion transport and metabolism, Q: Secondary metabolites biosynthesis, transport and catabolism, R: General function prediction only, S: Function unknown and X: Unnamed proteins.

Fig. S4: A representative figure depicting the validation of SNP loci (T to G) and (G to T) revealing missense non-synonymous amino acid substitutions [phenylalanine (TTT) to valine (GTT)] and [lysine (AAG) to asparagine (AAT)] in the abiotic and biotic stress responsive HSP (A) and NB-ARC functional domain (marked with arrows) encoding (B) *kabuli* genes, respectively differentiated the known stress tolerant wild *Cicer* accessions from sensitive cultivated *C. arietinum* (Ca) accessions. The non-synonymous SNPs are highlighted with rectangular boxes.

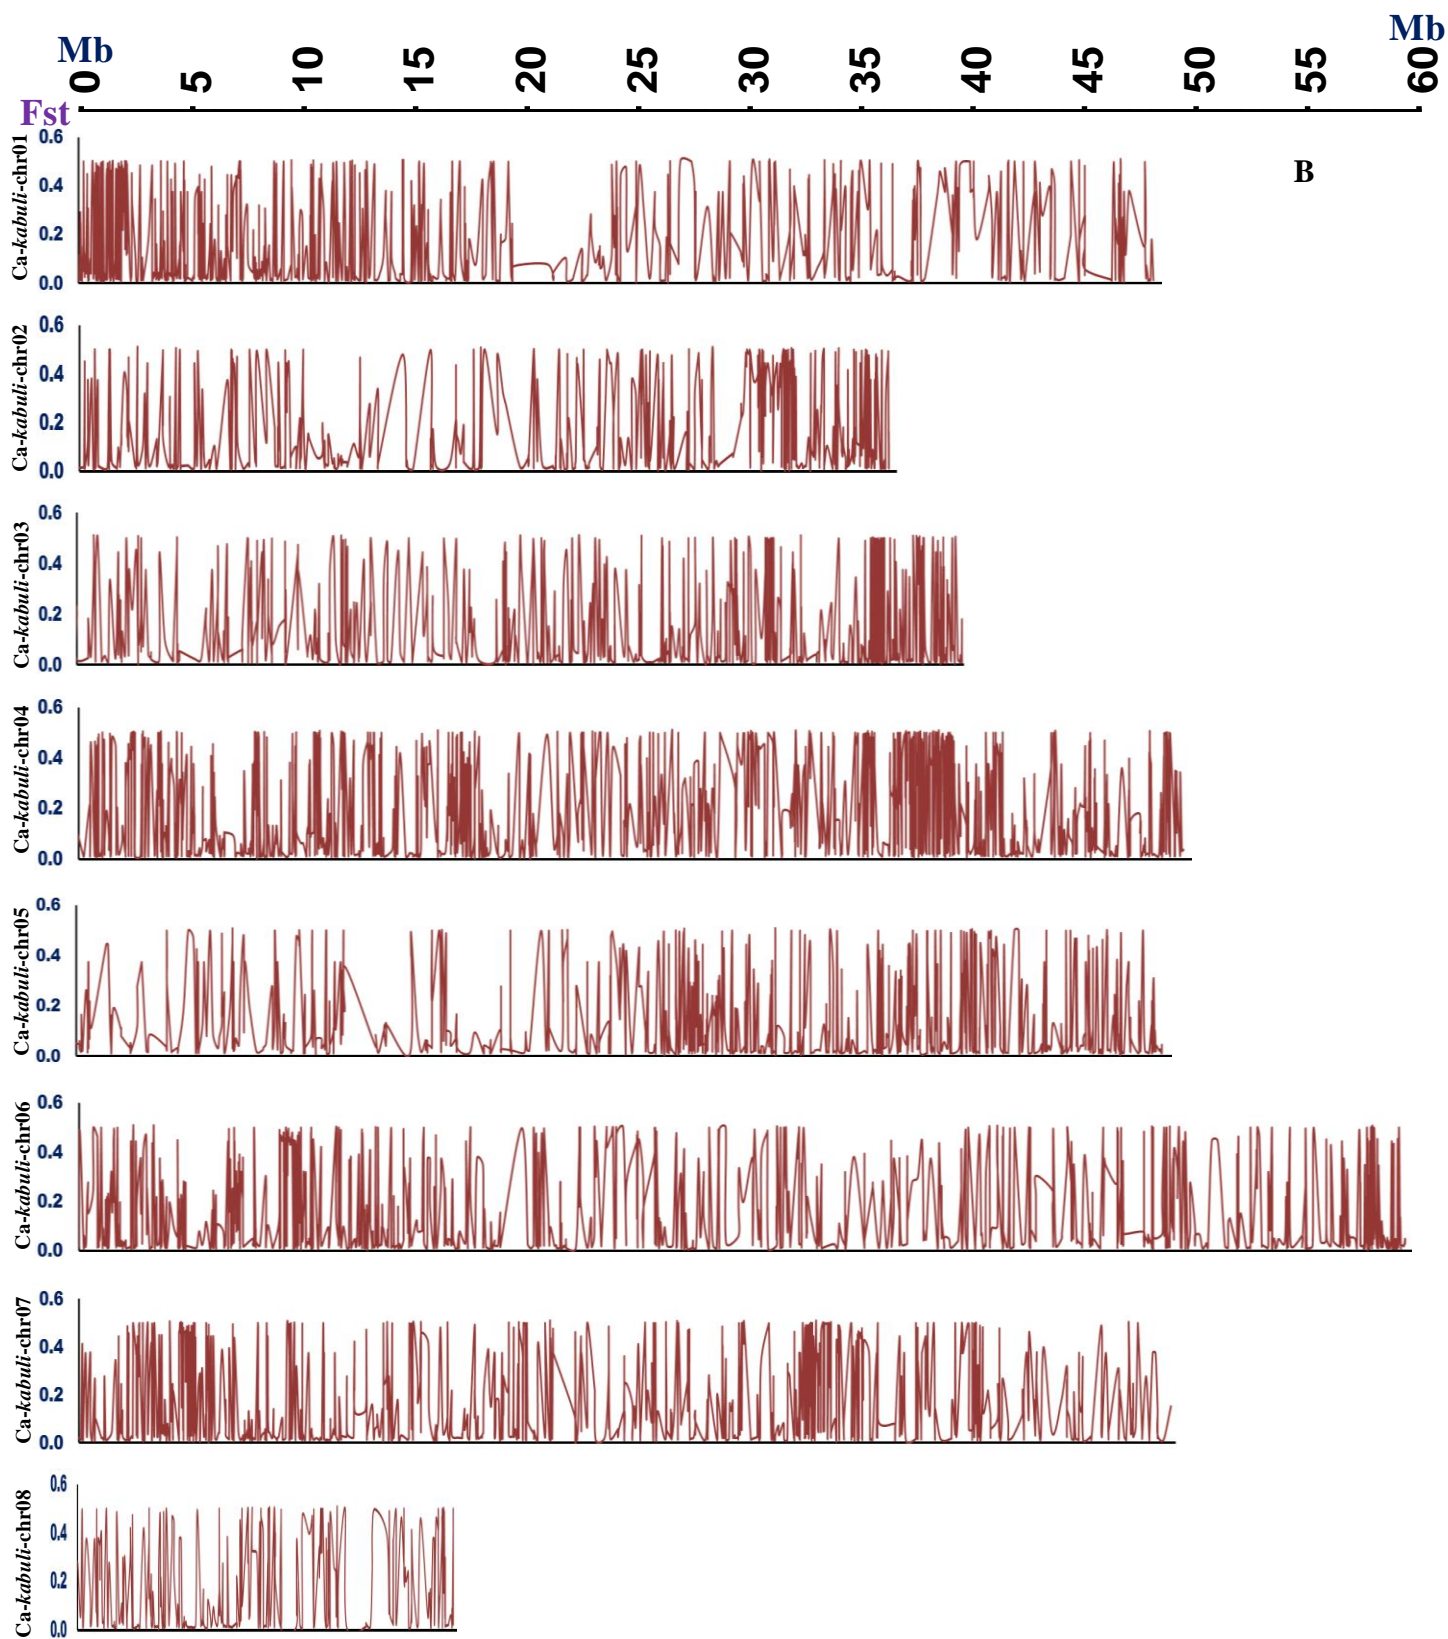

Fig. S5: Genomic distribution plots of F_{ST} in 93 wild and cultivated accessions determined across eight *desi* (A) and *kabuli* (B) chickpea chromosomes using 4672 and 11989 physically mapped GBS-based SNPs, respectively.

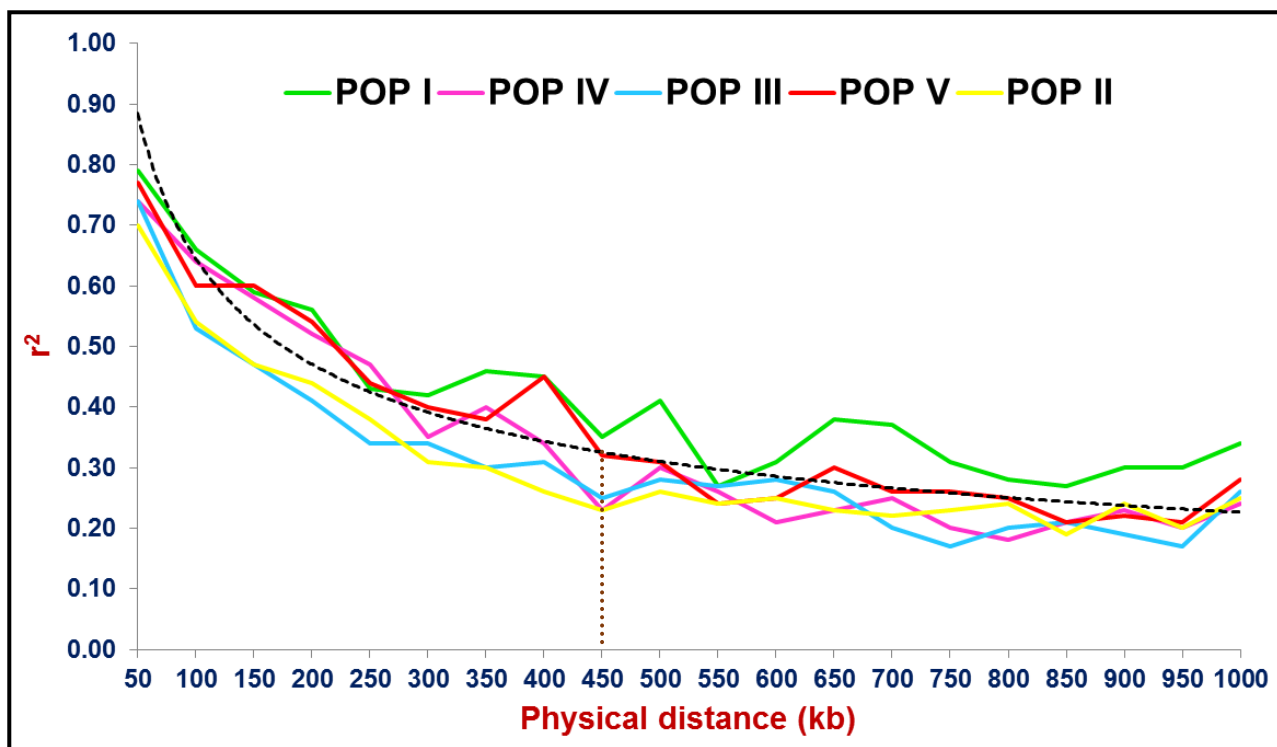

Fig. S6: LD decay (mean r^2) estimated in five structured populations (POP I - POP V) using 4672 *desi* genome (chromosome)-derived GBS-SNPs. The average r^2 estimated among SNPs spaced with uniform 50 kb physical intervals from 0 to 1000 kb are illustrated by the plotted curved lines. The LD decay for POP VI could not be calculated due to inclusion of only one wild accession within this population group. The dotted lines were plotted between pooled r^2 (across entire five populations) and physical distance (kb) based on nonlinear regression model considering the $r^2 = 1$ at marker physical distance of 0 kb and the trend of LD decay were estimated in wild and cultivated *Cicer* accessions.

Table S1: Wild and cultivated *Cicer* accessions selected for genome-wide discovery and high-throughput genotyping of SNPs using GBS-assay
