

Figure e-1. Propofol induced burts-suppression (A) and burst-suppression with identical bursts (B).

In propofol induced burst-suppression, bursts are heterogeneous and appear and disappear gradually, often without bilateral synchrony. Otherwise, in identical burst-suppression patterns, subsequent bursts are almost exactly similar, with bilateral synchrony, flat inter-burst intervals, and abrupt transitions between bursts and suppressions. Filter settings 0.5-25 Hz.
