

# Inferring 3D chromatin structure using a multiscale approach based on quaternions – Supplementary Material

Claudia Caudai, Emanuele Salerno, Monica Zoppè and Anna Tonazzini

Data for a 30 Mbp stretch of Chromosome 1, long arm, from lymphoblastoid cell line GM06990 were retrieved for both the Hi-C [8] and the expression experiments (ENCODE). Two stretches of about 3.5 Mbp were selected as representative of, respectively, highly and poorly expressed genomic regions (see figure below):

Highly expressed: from q = 153.3 Mbp to q = 156.8 Mbp,

Poorly expressed: from q = 162 Mbp to q = 165.5 Mbp.

Applying our algorithm we obtained 40 configurations. For each configuration, we calculated the mean-square Euclidean distances between pairs of loci as functions of their genomic distance in the high and low expression regions (see Fig. 4 of main text). The ratio  $\rho$  between the integral of the functions obtained for the two regions is reported in Table 1.

Two clusters were identified, defined by the threshold value  $\rho = 2$ . Those with  $\rho > 2$  (meaning that the span of the highly expressed region is at least twice as much as the poorly expressed counterpart) show a peculiar pear-like shape, clearly recognizable in the plots below.

**Table 1: Ratios  $\rho$  of the 40 configurations**

<b>Configuration</b>	<b>Ratio <math>\rho</math></b>
1	1.99
2	1.03
3	1.13
4	1.72
<b>5</b>	<b>2.51</b>
6	0.89
<b>7</b>	<b>5.66</b>
<b>8</b>	<b>3.36</b>
9	1.19
10	0.85
11	1.15
12	1.89
<b>13</b>	<b>2.41</b>
<b>14</b>	<b>2.92</b>
<b>15</b>	<b>3.28</b>
16	1.37
<b>17</b>	<b>3.03</b>
<b>18</b>	<b>2.46</b>
19	0.64
20	0.47
21	0.69
22	1.11
23	0.63
<b>24</b>	<b>3.11</b>
25	1.62
