

Supplemental Figure 6

Supplemental Figure 6. *Runx1-lz* shows a trend towards dominant repression of the MCSFR promoter. Bar graph showing average fold change in luciferase activity relative to renilla activity in 293 cells transfected with a plasmid expressing luciferase under the control of the MCSFR promoter, a renilla control plasmid, and plasmids expressing the indicated transcription factors. Each transfection was performed in triplicate in each of 3 independent experiments. Brackets indicate the samples being compared with the associated p-values.
