

Materials and Methods

Cell culture

MHCC-LM3, HeLa, MCF-7, SMCC-7721, MGC-803 and HEK-293T cells were cultured in Dulbecco's modified Eagle's medium (DMEM) supplemented with 10% fetal bovine serum (FBS) and 1% penicillin-streptomycin solution. HCT-116 was grown in McCoy's 5A Modified medium with 10% FBS and 1% penicillin-streptomycin solution. NCI-H1299 was cultured in RPMI-1640 supplemented with 10% FBS and antibiotics.

Exosomes isolation

To isolate cell-derived exosomes, cells were cultured in serum-free medium for 24 h. Then the medium was collected to extract exosomes using differential ultracentrifugation methods essentially as described in the literature¹. Briefly, medium was centrifuged at 500xg for 5 min, 2000xg for 5 min, and finally at 4600xg for 20 min at 4°C to remove cells and debris; and eventually ultracentrifuged at 134,000xg for 70 min at 4°C using a Beckman ultracentrifuge. For serum samples, the exosomes were isolated using Total Exosome Isolation (from serum) (Invitrogen, Carlsbad, CA, USA) following the manufacturer's protocol. The isolated exosomes were eluted in PBS and used immediately or stored at -80°C.

Transmission electron microscopy (TEM)

The exosomes were separated by ultracentrifugation and the pellet was resuspended in PBS. One drop of the resuspended exosomes was put on a copper mesh for 1min. The fluid was then absorbed from the edges of the copper mesh with filter paper. The copper mesh was stained with 1% uranyl acetate in ddH₂O for 1min. The sample was dried for 5 min under incandescent light

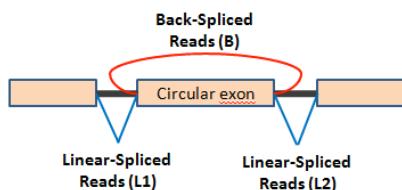

after the staining solution was absorbed by the filter paper. The copper mesh was placed under transmission electron microscope (FEI, Tecnai G2 spirit) and photographed.

RNA-seq analysis

Total RNA was extracted using TRIzol or TRIzol LS Reagent (Invitrogen). Poly(A) RNA was purified with two rounds of hybridization to Dynaloligo(dT) beads (NEB). Total RNA and exosomal RNA samples were treated with RiboMinus™ Eukaryote Kit (Qiagen) to remove ribosomal RNA before constructing RNA-seq libraries. Ribosome depleted RNA was treated with RNase R (Epicentre) for RNA-seq analysis of RNase R treated samples. Strand-specific RNA-seq libraries were prepared using NEBNext Ultra Directional RNA Library Prep Kit for Illumina (NEB) following the manufacturer's instructions. Briefly, RNA samples (about 50 ng) were fragmented and then used for first- and second-strand cDNA synthesis with random hexamer primers. For second-strand cDNA synthesis, dUTP mix (without dTTP) was used which allows for the removal of the second strand. The cDNA fragments were treated with End-It DNA End Repair Kit to repair the ends, then modified with Klenow to add an A at the 3' end of the DNA fragments, and finally ligated to adapters. Ligated cDNA products were prufied and treated with uracil DNA glycosylase to remove the second-strand cDNA. Purified first-strand cDNA was subjected to 14 cycles of PCR amplification. Library quality was determined on Bioanalyzer 2100 (Agilent).

The strand-specific RNA-seq libraries were sequenced using IlluminaHiSeq 2500 platform. Reads were mapped to human reference genome GRCh37/hg19 using TopHat v2.0.8b². Similar sequencing depths (45.0M reads for cells, 45.3M for cell-derived exosomes, 31.0M for normal serum exosomes, 40.8M for CRC serum exosomes) were achieved from different Ribo(-) RNA-seqs. RNase R treated samples were sequenced with a small depth (21.0M for cell sample and 3.5M for exosomes sample). Notably, the low sequencing depth of RNase R treated exosomes sample may be due to the more completed digestion of RNase R in exosomes sample as we found

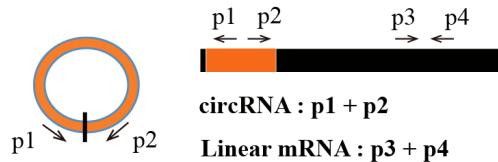

similar number of circular RNAs identified from both RNase R treated samples though their sequencing depths are different. A computational pipeline³ based on anchor alignment of unmapped reads was used to identify circRNAs. Briefly, The unmapped reads were extracted 20mers from both ends and aligned them independently to find unique anchor positions within spliced exons. Anchors that aligned in the reversed orientation (head-to-tail) indicated circRNA splicing. Then the anchor alignments were extended such that the complete read aligns and the breakpoints were flanked by GU/AG splice sites. Ambiguous breakpoints were discarded. Notably, we used TopHat2 but not Bowtie2 for RNA-seq reads mapping because we found some junction reads could not be mapped correctly to genome using Bowtie2 (Unpublished data). Counts of reads mapping across an identified backsplice are normalized by read length and number of reads mapping (spliced reads per billion mapping [SRPBM]). We calculated the number of reads mapping from all gene regions. Gene coordinates were downloaded from the RefGene tables in the UCSC Genome Browser (downloaded on 03/28/2014). The identified circRNAs from cells and cell-derived exosomes were calculated using SRPBM and represented using Circos plots⁴. The representative RNA-seq results for the HIPK3 gene and circ-HIPK3 (exon2) locus in various RNA-seq libraries were obtained using Integrative Genomics Viewer (IGV)⁵. The back-spliced ratio of circRNA and its linear transcript from RNA-seq was calculated as suggested below. For comparison of the exo-circRNA profile of normal serum and that of colon cancer serum, the commonly expressed circRNAs were considered with SRPBM>0.6 (at least one read in both library), while the specific expressed circRNAs were chosen using a stringency of SRPBM cut-off (SRPBM>6). The expression level of protein coding genes for the new circRNAs in CRC cancer patients was analyzed by 27 paired CRC samples from TCGA cohort.

$$\text{Back-Spliced Ratio} = B / (0.5 \times L1 + 0.5 \times L2)$$

Quantitative reverse transcription polymerase chain reaction (qRT-PCR)

cDNA was synthesized with the PrimeScript RT reagent kit (Takara Bio Inc., Dalian, China). Real-time PCR analyses were performed with SYBR Premix Ex Taq (Takara Bio Inc.). Outward facing primers were designed to amplify specific circRNAs (See below). β -actin was used as an internal control. The primers are listed in Supplementary Table S3.

Animal models

To analyze circulating exo-circRNA from cancer-bearing mice, BALB/c-nu/nu mice were subcutaneously implanted with 4×10^6 MHCC-LM3 liver cancer cells. After 8 weeks, mice were sacrificed and peripheral blood was obtained by retro-orbital bleeding. Serum was separated from blood cells by sequential centrifugation at $500 \times g$ for 10 min followed by $3000 \times g$ for 20 min, and subjected to exosomal RNA isolation. Mice were handled and housed according to protocols approved by the Shanghai Medical Experimental Animal Care Commission.

Serum collection and exosomal RNA extraction

Whole blood samples were obtained from tissue bank of Fudan University Shanghai Cancer Center. All people had signed informed consent for donating their samples to tissue bank of

Fudan University Shanghai Cancer Center. Whole blood was separated into serum and cellular fractions within 2 h after blood was derived, and serum were stored at -80 °C. Serum exosomes were isolated as indicated above. Exosomal RNA was extracted using TRIzol LS Reagent (Invitrogen) in the presence of glycogen.

Cell transfection and cell proliferation assay

miR-7 mimics were synthesized by Ribobio (Guangzhou, China). CDR1as expression vector was constructed by cloning CDR1as sequences into two complementary repeat elements driven by CMV promoter. The oligonucleotide or plasmid transfection was performed using the Lipofectamine 2000 reagent (Invitrogen). The cell-derived exosomes were collected 48 h after transfection.

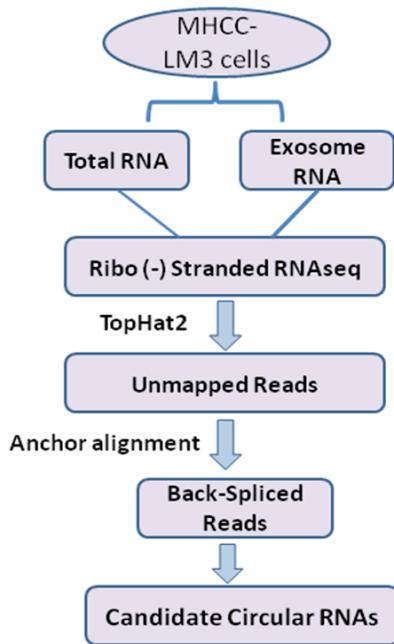

For cell proliferation assay, miR-7 mimics or negative control were transfected into SMCC-7721 liver cancer cells in 96-well plate. After 4 h transfection, CDR1as exosomes or control exosomes were added to the transfected cells. The cells were subsequently incubated for 48 h, and cell proliferation was measured using the Cell Counting Kit-8 (CCK-8) (Dojindo Corp., Japan). CDR1as exosomes and control exosomes were collected from cell culture medium after transfection with CDR1as expression vector or control vector in HEK-293T cells. Notably, we performed the functional assay in SMCC-7721 liver cancer cell because miR-7 was reported to function as a tumor suppressor in liver cancer (Fang et al., Hepatology, 2012) and CDR1as circular RNA was found to be dysregulated in liver cancer tissues compared with matched normal tissues (data not shown). We conducted the experiment regarding the regulation of circular RNA sorting to exosomes by associated miRNA in HEK-293T and MCF-7 cells, because CDR1as circular RNA is highly expressed in both cells.

Statistical analysis

The results are presented as the means \pm S. D. The data were subjected to Student's t-test (two-tailed, with $p < 0.05$ considered significant) or Pearson's correlation analysis.

Supplementary information, Figure S1 RNA-seq analysis of circular RNAs in MHCC-LM3

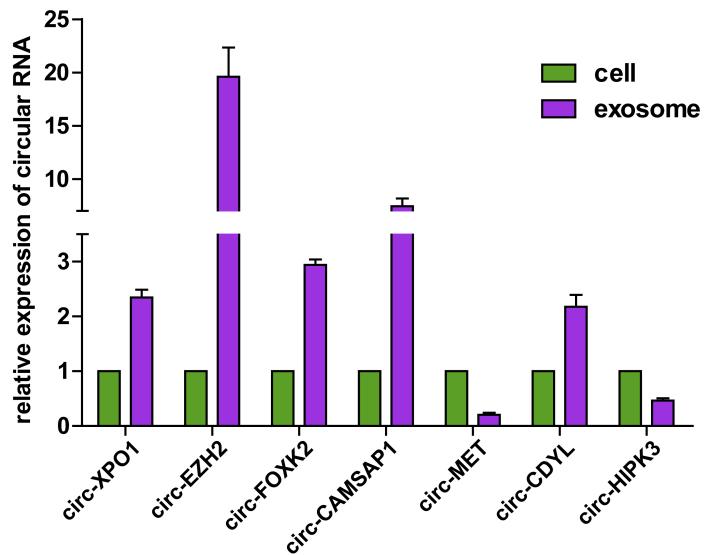

cells and cell-derived exosomes.

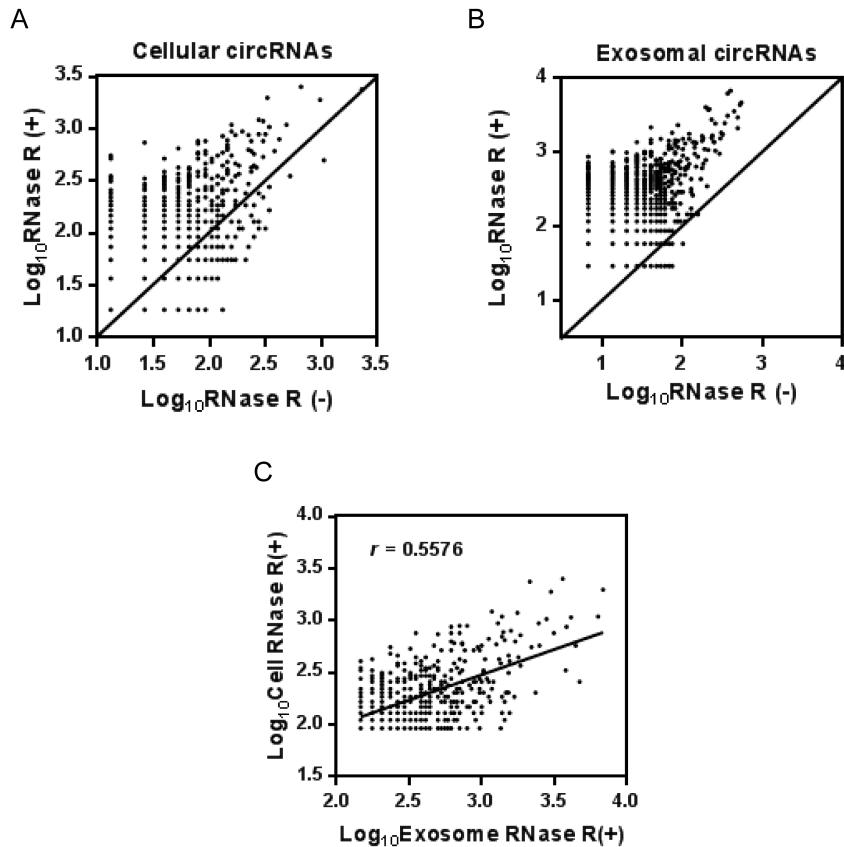

Supplementary information, Figure S2 Transmission electron micrograph of exosomes isolated from MHCC-LM3 cells. The scale bar is 50 nm.

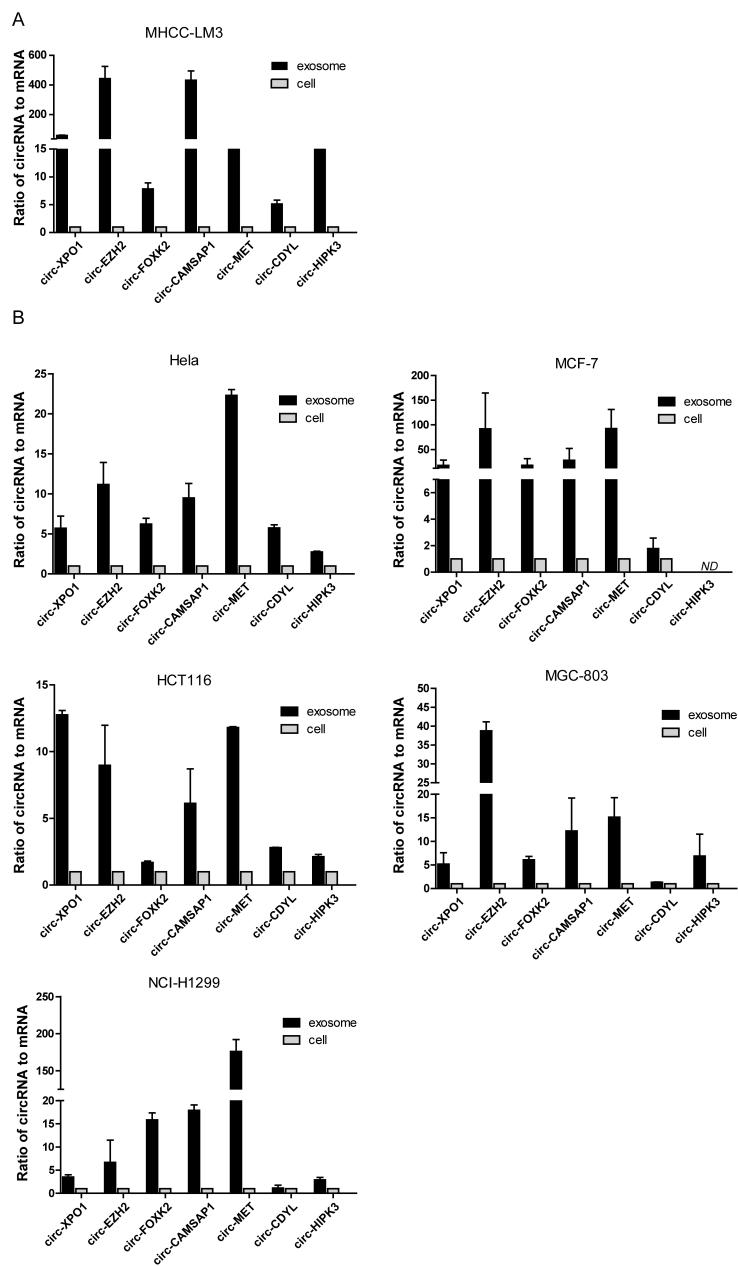

Supplementary information, Figure S3 The number of circular RNAs identified from different RNA-seq libraries. When using a stringency of SRPBM cut-off, the number of exo-circRNA is significant higher than that of cellular circRNA, while circRNA is almost absent in polyA(+) RNAseq library.

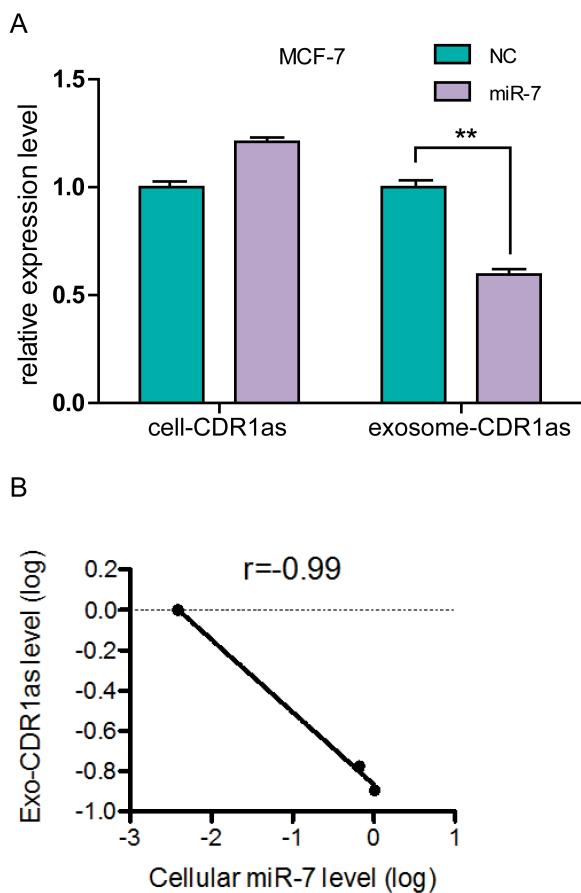

Supplementary information, Figure S4 qRT-PCR analysis of seven circRNAs after reverse transcription (RT) on same amount of cellular RNA and exosomal RNA. The level in cell was set as 1. Data are presented as means \pm standard deviation (S.D.). MET and HIPK3 circular RNAs are higher in cells than exosomes, while the other five circular RNAs are lower in cells than exosomes. Notably, the length of MET and HIPK3 circular RNAs is much longer than that of others (circ-MET 1,214nt, circ-HIPK3 1,099nt, circ-CDYL 667nt, circ-CAMSAP1 426nt, circ-EZH2 355nt, circ-FOXK2 346nt, circ-XPO1 307nt), suggesting that the length of circular RNA might be linked to the regulation of circRNA sorting into exosomes.

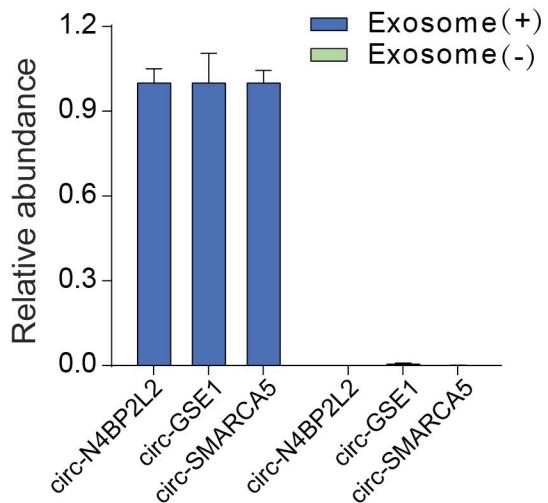

Supplementary information, Figure S5 RNA-seq analysis of circRNAs in MHCC-LM3 cells and cell-derived exosomes with or without RNase R treatment. **(A)** circRNAs are enriched in MHCC-LM3 cells with RNase R treatment compared with cells without RNase R treatment. **(B)** circRNAs are enriched in MHCC-LM3 cell-derived exosomes with RNase R treatment compared with exosomes without RNase R treatment. **(C)** Correlation between cellular circRNAs and exo-circRNAs after RNase R treatment.

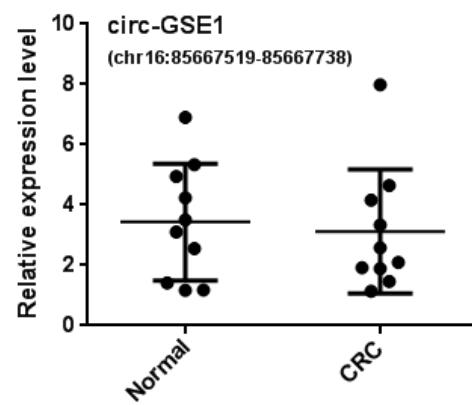

Supplementary information, Figure S6 qRT-PCR analysis the ratio of circRNA to mRNA between cells and cell-derived exosomes. **(A)** qRT-PCR analysis the ratio of circRNA to mRNA between MHCC-LM3 cells and cell-derived exosomes. **(B)** qRT-PCR analysis the ratio of circRNA to mRNA between cells and cell-derived exosomes in various cancer cells. The ratio in cell was set as 1. Data are presented as means \pm standard deviation (S.D). ND represents not determined.

Supplementary information, Figure S7 (A) qRT-PCR analysis of CDR1as circular RNA expression level after transfection with control or miR-7 mimics in MCF-7 cells and cell-derived exosomes. Data are presented as means \pm S.D. **P<0.01, by Student's t-test. (B) The relationship between the amount of miR-7 expressed in cells and the levels of CDR1as circular RNA in the exosomes generated by the cells. HEK293T cells were transfected with different amount of miR-7 mimics. The levels of miR-7 in cells and CDR1as circular RNA in the exosomes were determined by qRT-PCR analysis. Data was plotted and Pearson correlation was analyzed. The result showed that there was an inverse relationship between the amount of miRNAs expressed in cells and the levels of circRNAs in the exosomes generated by the cells.

Supplementary information, Figure S8 qRT-PCR analysis of three circRNAs in serum-derived exosomes and exosomes-depleted serum. The level in serum-derived exosomes was set as 1. Data are presented as means \pm S.D. Notably, the exosomes-depleted serum did not contain microvesicles. Thus, herein we could not exclude the possibility of circRNAs being present in microvesicles.

Supplementary information, Figure S9 qRT-PCR analysis of serum circ-GSE1 level in normal serum and colon cancer serum ($n=10$, respectively). Serum expression level of circ-GSE1 is not significantly different between cancer serum and NS ($P>0.05$ by Student's t -test).
