Supplemental Table S3. iTRAQ data of proteomics analysis during primary of peptides and protein groups (A), and unique peptide, protein

ing chromoplast differentiation and list of quantitative proteins
tein groups used for quantitative comparison are listed in the table

Supplemental Table S4: Characteristics of the 1386 citrus pulp plastid protein iTRAQ.

The raw data were searched against a non-redundant Protein Index *C.sinensis* p (Huazhong Agricultural University; <http://citrus.hzau.edu.cn>) and the proteome from the chloroplastic genome (accession no. NC_008334). Identified proteins ("identifications") are depicted by the accession, molecular weight (MW), and the identified peptides per protein in two 8-plex iTRAQ experiments. The subcellular localization was predicted by the TargetP (<http://www.cbs.dtu.dk/services/TargetP/>), Predotar (<http://urgi.versailles.inra.fr/predotar/predotar.html>), and WoLF PSORT (<http://www.hgc.jp/~wolfpsort/>). Homologies of the detected proteins were searched against five plastidial databases: (i) two databases specific to plastids (Plprot, <http://www.plprot.ethz.ch/>; AT_CHLORO, http://www.grenoble.prabi.fr/at_chloro/); and (ii) three databases comprising plant databases (SUBA, <http://suba.plantenergy.uwa.edu.au/>; PPDB, <http://ppdb.tc.cornell.edu/>; Uniprot, <http://www.uniprot.org/>). We accepted those proteins as true plastid proteins (column "BLAST-search & subcellular localization") which (i) at least one targeting predictor predicted to localize in the plastid, and (ii) at least two of the five databases mentioned above (Plprot, AT_CHLORO, SUBA, PPDB, UNIPROT). All proteins encoded by the plastid genome (listed as GI code) were retained. GI codes were added to novel putative plastid proteins (present research).
