

Supplementary Figure 1: Assessing gene expression, food intake and barrier function in malnourished and control mice. (a) The average daily intake of chow was determined by weighing the food each day and averaging difference in weight of the food over 3 weeks of mice on each of the diet. The mRNA expression of (b) *IGF1* and (c) *ACE2* in the jejunum was determined by real-time qPCR analysis. (d) The concentration of secretory IgA in the fecal content and jejunal content was assessed using an ELISA. (e) Representative images and histological assessment of AB-PAS stained jejunal tissues from malnourished and control mice. Mucins stain a blue or dark purple on the outer edge of each tissue, and mucus-secreting goblet cells stain dark purple in the epithelium. The number of goblet cells was enumerated and graphed for each tissue. Scale bar represents 100 μ m in length. Bars indicate the mean with S.E, and all data are representative of 2 independent experiments, 8 mice per group (* $p < 0.05$, Student's *t*-test).

Supplementary Figure 2: High-throughput 16S rRNA sequencing of the small intestinal microbiota in malnourished and control mice. (a) A chart summarizing the percent abundance of the duodenal (n=4) and ileal (n=3) microbiota by family classification in each individual mouse, using the 16S rRNA gene. **(b)** The pooled percent abundance of the duodenal microbiota by phylum and genus taxonomic classification using the 16S rRNA gene. **(c)** A graph of the diversity in the duodenal microbiota of the malnourished and control mice (n=4) as measured by the inverse Simpson's Index method. Bars indicate the mean with S.E. (p=0.08, Student's *t*-test). **(d)** Percent abundance of OTUs that are either Gram-negative or Gram-positive in the duodenum and ileum of malnourished and control mice.

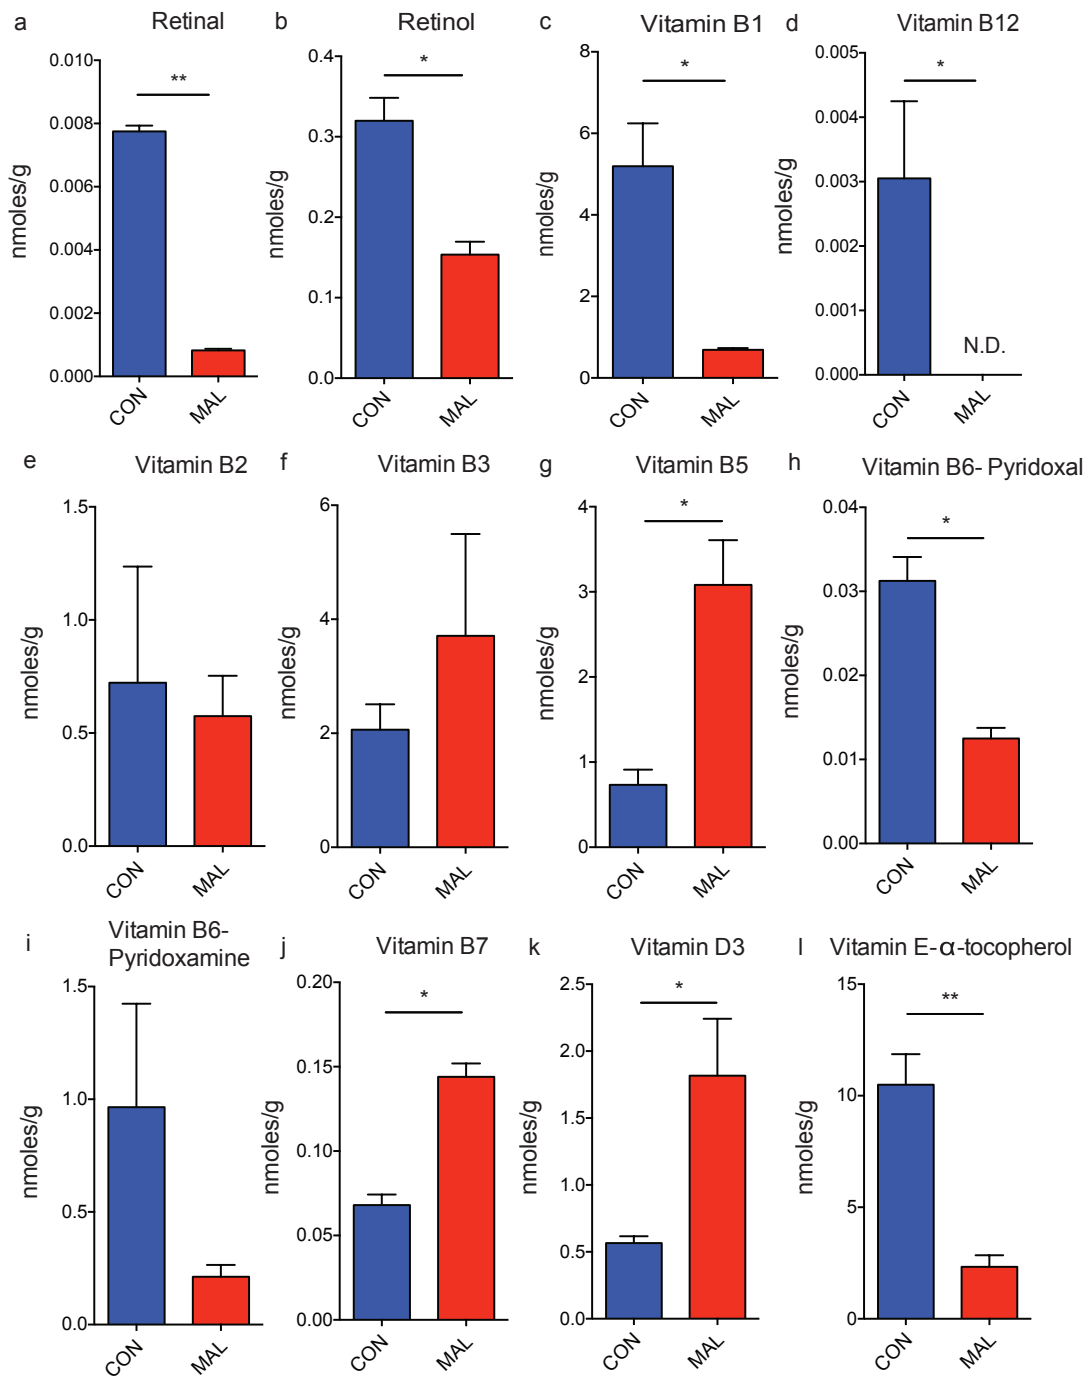

Supplementary Figure 3: Untargeted metabolomics of the small intestinal metabolome.

(a) A PCA plot showing separation of the metabolomic data from the malnourished mice (green) and control mice (red) as detected by the negative ion channel. (b) A heat map of the relative abundance of all metabolites identified from the small intestinal metabolome as detected by the negative ion channel from malnourished and control mice (n=4). The malnourished and control samples clustered together in the dendrogram based upon cluster analysis by the Ward method, with a Pearson distance measure. The heat map scale is a \log_2 base, from the range of -3 (blue) to +3 (red).

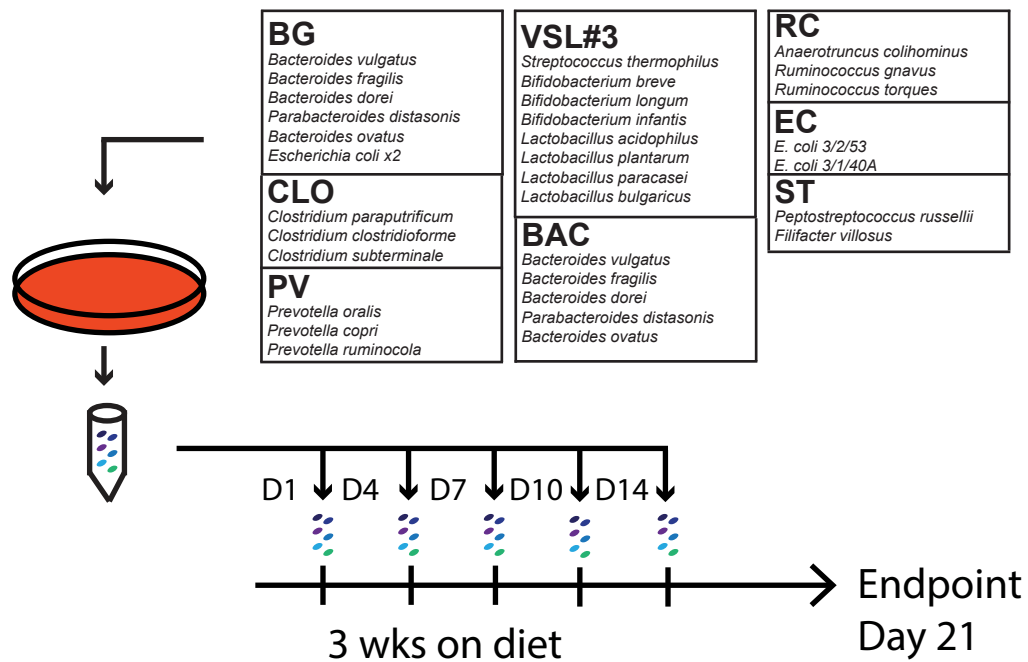

Supplementary Figure 4: Bile acid targeted metabolomics. Pooled data representing all bile acids found in the small intestinal content of malnourished and control mice that are either (a) tauro-conjugated or (b) unconjugated bile acids. (c) The ratio of the concentrations of conjugated:unconjugated bile acids in the small intestine. Bars indicate the mean with S.E, 3-4 mice per group (* $p < 0.05$, Student's t -test).

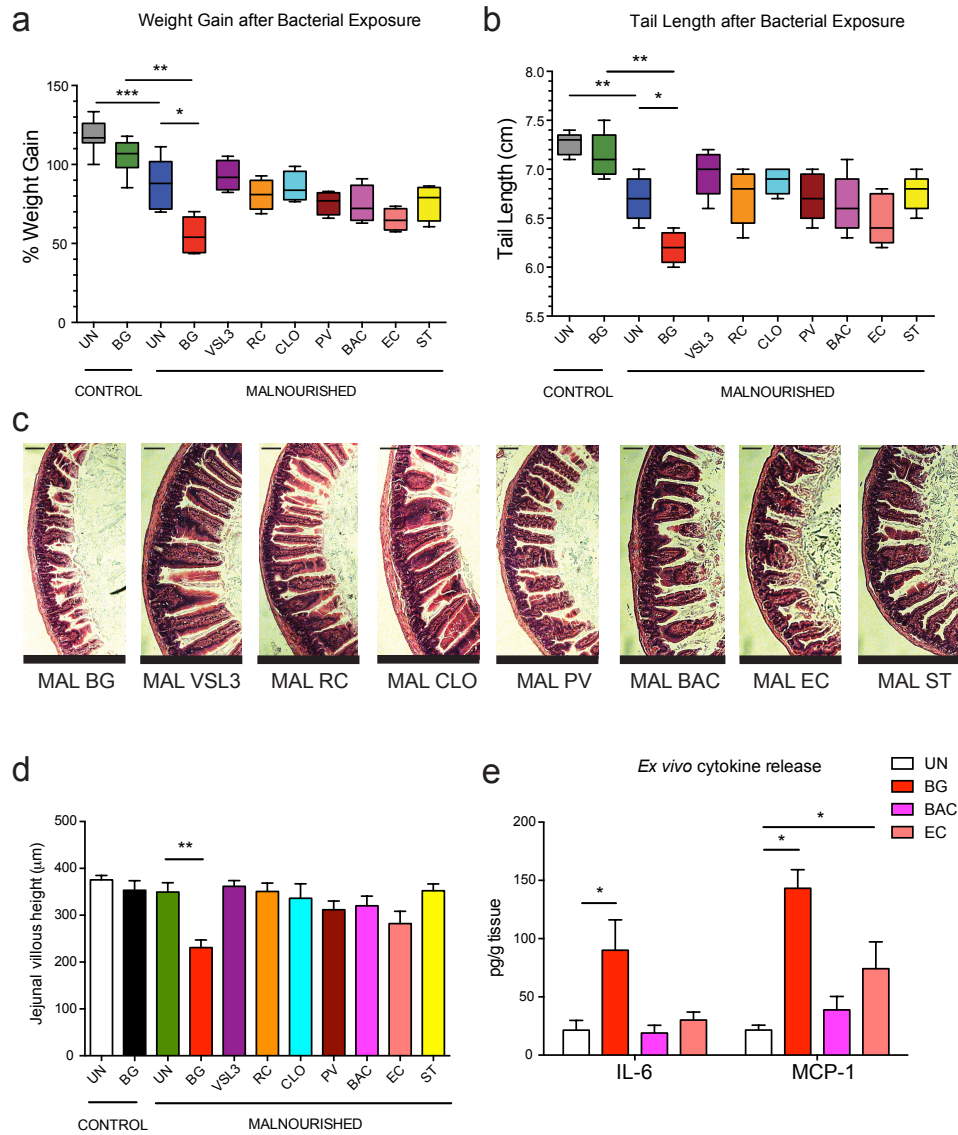

Supplementary Figure 5: Vitamin-targeted metabolomics. The concentrations of 12 vitamins found in the small intestinal content of malnourished and control mice. Bars indicate the mean with S.E, 4 mice per group, N.D. equals not detected. Statistical analysis was performed using the Mann-Whitney *U*-test (* $p < 0.05$, ** $p < 0.01$)

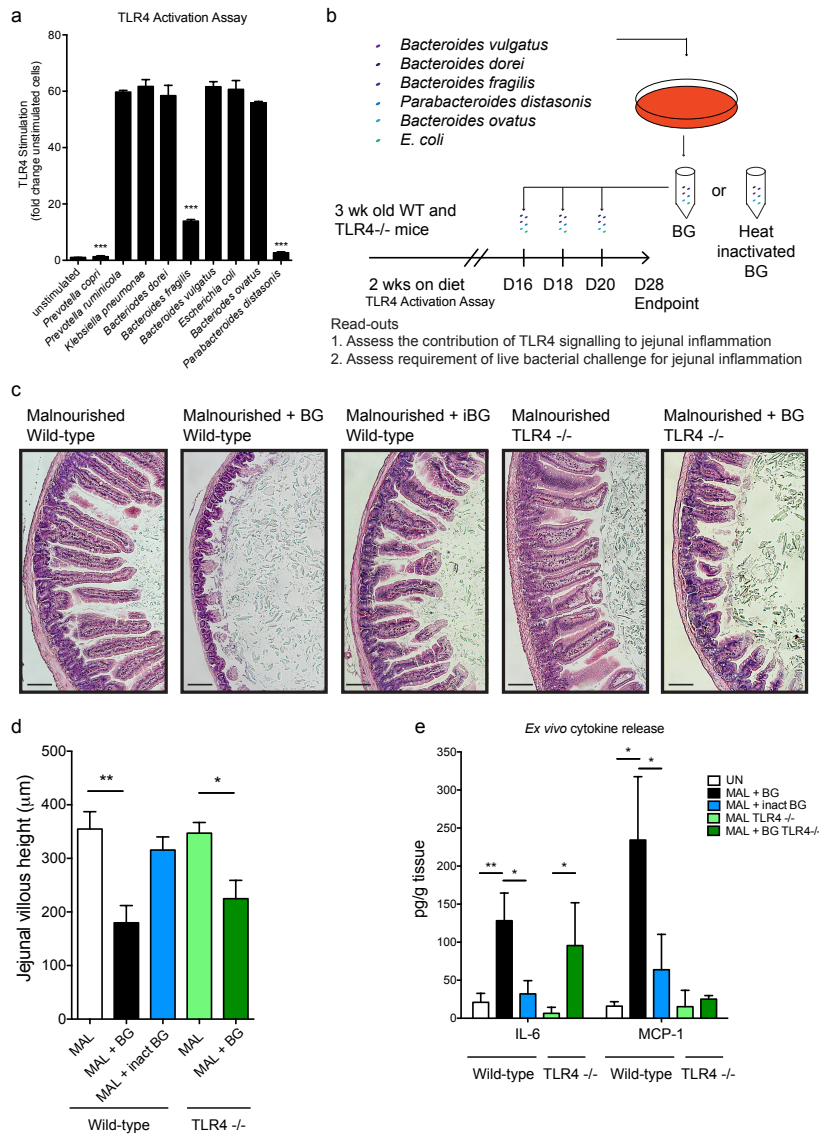

Supplementary Figure 6: Short-chain fatty acid analysis. (a) The concentration of 7 short-chain fatty acids (SCFAs) in the small intestinal content of malnourished and control mice. The concentrations of isobutyric, isovaleric and valeric acid were not detected (N.D.) in this analysis. (b) Pooled data representing the sum of all SCFAs found in the small intestine of malnourished and control mice in this analysis. Bars indicate the mean with S.E, 4 mice per group.

Supplementary Figure 7: Experimental design used to screen of the impact of oral exposure to various microbial mixtures on the growth rate, villous architecture and inflammatory markers in mice. A schematic of the experimental design used to administer the various microbial cocktails to malnourished mice. Three-week old mice were given the malnourished diet and exposed to each microbial mixture listed by oral gavage 5 times over a 2-week period. After the experimental endpoint 1 week later, mice were assessed for growth rate, tail-length, villous architecture and, in some cases, inflammation.

Supplementary Figure 8: A screen of the impact of oral exposure of C57Bl/6 mice to various microbial mixtures on growth rate, villous architecture and inflammatory markers in malnourished mice. After 3 weeks of exposure to each microbial mixture and being fed each diet, the total amount of (a) weight gained and (b) final tail lengths were calculated. Data on malnourished and control, unexposed mice (MAL-UN and CON-UN) are the same as presented in Figure 1, for comparison (n=8). The remaining data is based on 5 mice per group and is representative of 2 independent experiments (c) Representative images of the jejunal architecture from H&E stained tissues from malnourished mice exposed to the microbial mixtures. Scale bar represents 100 µm in length (d) The histological assessment of villous height were measured in the malnourished and control mice exposed and unexposed to the microbial mixtures over a period of 3 weeks. Data from the images and graphs are representative of 2 independent experiments, 5 mice per group (e) Concentrations of IL-6 and MCP-1 released in the tissue culture media by jejunal sections of tissue from BG-exposed, EC-exposed, BAC-exposed and unexposed malnourished mice as measured by a cytokine bead array. Data is representative of 2 independent experiments, 5 mice per group. Statistical analysis was performed using a one-way ANOVA with post hoc Tukey's test (*p<0.05, **p<0.01, ***p<0.001).

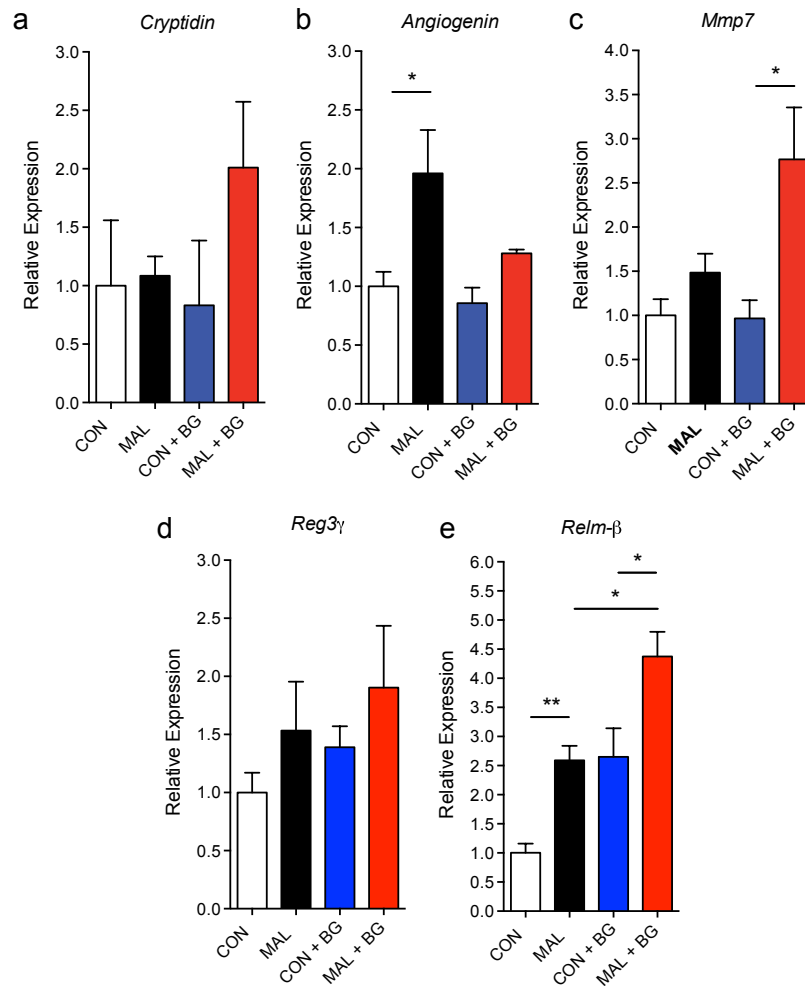

Supplementary Figure 9: An assessment of the requirement of TLR4 signaling and metabolically active bacteria in the inflammatory potential of the *Bacteroidales-E. coli* gavage. (a) A selection of Gram-negative LPS-containing microbes utilized in previous experiments (BG mix, *Prevotella* mix), along with a *Klebsiella* isolate were incubated with a TLR4 reporter cell line to assess the potential of each microbe to activate TLR4 signaling. Bars indicate the means, +/- S.E. of the fold change in activated compared to an unstimulated control. (b) A schematic of the experimental design for the following experiments in TLR4-deficient mice and wild-type mice given a heat-inactivated BG. (c) Representative images of the jejunal architecture from of H&E stained tissues in BG exposed and unexposed TLR4-deficient mice, wild type mice and wild-type mice given a heat-inactivated BG (iBG) mix. Scale bar represents 100 µm in length (d) Histological assessment of villous height in the malnourished and control mice exposed and unexposed to BG or heat-inactivated BG. Data from the images and graphs in wild-type mice are representative of 2 independent experiments, 8 mice per group. The TLR4-deficient mice data was based upon 6 mice per group. (e) Concentrations of IL-6 and MCP-1 released in the tissue culture media by jejunal sections of tissue from BG-exposed, inactivated BG exposed and unexposed malnourished mice as measured by a cytokine bead array. Bars indicate the means, +/- S.E. Statistical analysis was performed using a one-way ANOVA with post hoc Tukey's test (*p<0.05, **p,0.01).

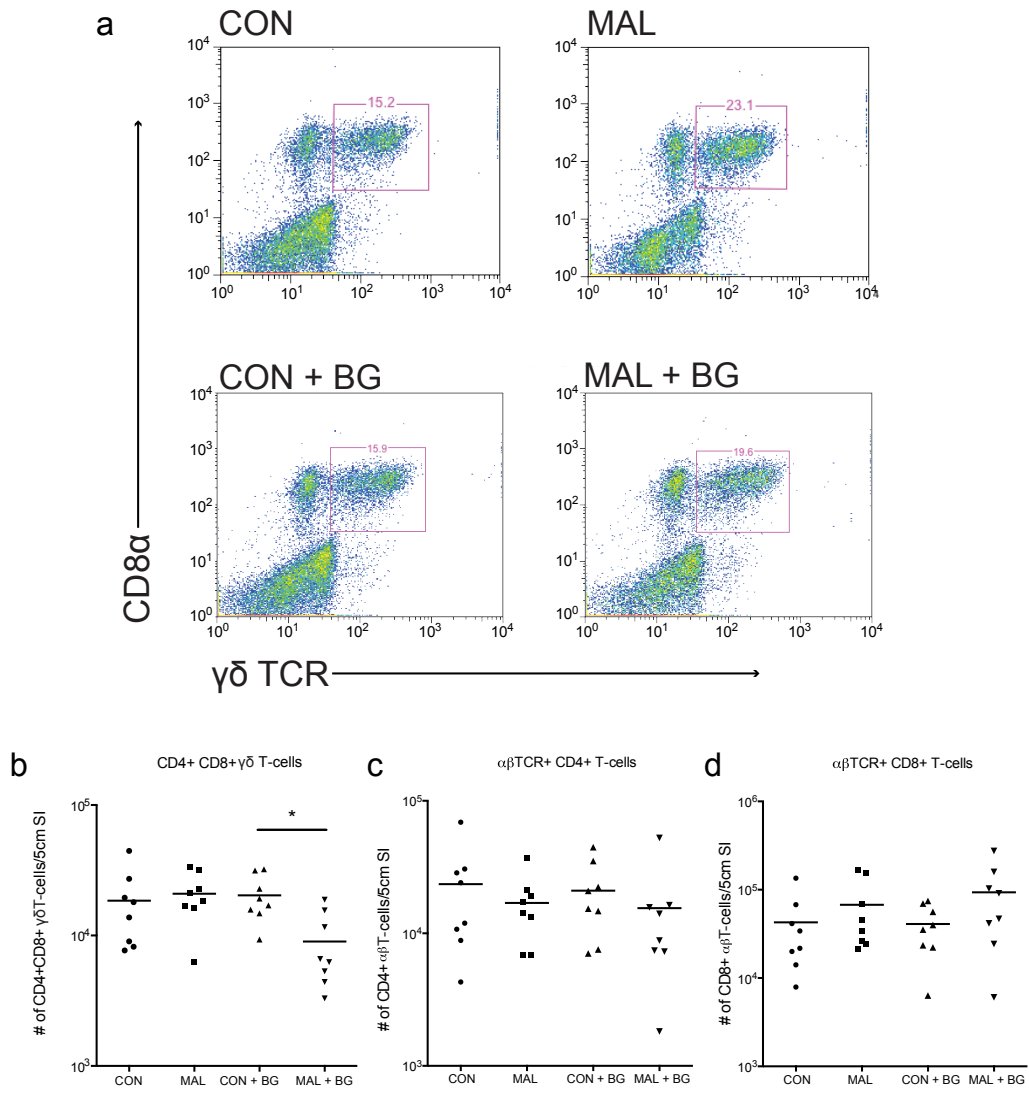

Supplementary Figure 10: FISH analysis of the Bacteroidetes in malnourished and control mice with or without *Bacteroidales-E. coli* oral exposure. Jejunal tissues preserved in Carnoy's solution were probed for Bacteroidetes-specific 16S rDNA (BAC) abundance using FISH. Images are representative of BG-exposed and unexposed malnourished and control mice. Actin is stained in green (488PHalloidin), cell nuclei in blue (DAPI) and bacteria are stained in red (Bac303). Scale bar indicates 100 μ m length, and arrows indicate tissue-associated Bacteroidetes.

Supplementary Figure 11: FISH analysis of the Firmicutes in malnourished and control mice with or without *Bacteroidales-E. coli* oral exposure. Jejunal tissues preserved in Carnoy's solution were probed for Firmicutes-specific 16S rDNA abundance using FISH. Images are representative of BG-exposed and unexposed malnourished and control mice. Actin is stained in green (488PHalloidin), cell nuclei in blue (DAPI) and bacteria are stained in red (LGC354a-c). Scale bar indicates 100 μ m length, and arrows indicate tissue-associated Firmicutes.

Supplementary Figure 12: Assessing the jejunal gene expression of antimicrobial defense proteins by RT-qPCR. The relative expression of (a) cryptidin, (b) angiogenin-4, (c) matrix metalloproteinase-7, (d) Reg3- γ and resistin-like molecule- β in the jejunum of BG exposed and unexposed mice on each diet was determined by real-time qPCR analysis. Graphs are representative of 2 independent experiments, 8 mice per group. Bars indicate the mean values \pm S.E. (* p <0.05, Student's t -test).

Supplemental Figure 13: Flow cytometry of small intestinal intraepithelial lymphocytes.

(a) A graph generated by FlowJo showing the gating of CD8+ $\gamma\delta$ TCR+ T-cells from CD45+ live lymphocytes isolated from the upper 5 cm of the small intestine (duodenum) in BG-exposed and unexposed mice on each diet. The total number of (b) CD45+CD3+CD8+CD4+ $\gamma\delta$ TCR+ cells, (c) CD45+CD3+CD4+ $\alpha\beta$ TCR+ cells and (d) CD45+CD3+CD8+ $\alpha\beta$ TCR+ cells isolated from a 5 cm portion of the duodenum in BG-exposed and unexposed mice on each diet. All data are representative of 2 independent experiments (n=8). Bars indicate the mean values (*p<0.05, one-way ANOVA with post hoc Tukey's test).

Supplementary Figure 14: Uncropped claudin-2 western blot from jejunal epithelial cells. Levels of CLDN2 protein blotted from extracted protein from jejunal IECs. Single bands can be visualized in the expected region for the protein claudin-2 (~24kDa). Actin was used as the loading control, and a consistent abundance of actin could be visualized across all samples.

Supplementary Table 1: A breakdown of the ingredients and calorie content in the malnourished and control diet.

Ingredients	Control Diet		Malnourished Diet	
	Grams (%)	Kcal (%)	Grams (%)	Kcal (%)
Casein	200	800	71	284
