488181049	glyceraldehyde-3-phosphate dehydrogenase, type I [ <i>Neisseria meningitidis</i> ]			0.688	0.576	0.276	0.579
488186253	hypothetical protein, partial [ <i>Neisseria meningitidis</i> ]			0.710	0.594	0.266	0.56
488190078	3-deoxy-D-manno-octulonate 8-phosphate phosphatase, YrbI family protein, partial [ <i>Neisseria meningitidis</i> ]			0.727	0.608	0.281	0.591
504393427	ATP-dependent metalloprotease [ <i>Neisseria meningitidis</i> ]			1.668	1.396	0.608	1.278

Protein samples were prepared as follows: bacteria infected to HBMEC (see Materials and Methods) were suspended in 70 µl of 100 mM Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub> (pH 7.5). Ten µl of 20 mM Tris (2-chloroethyl)phosphate (TCEP) and 10 µl of 10% SDS were added, and then the

bacterial suspension was incubated at 95 °C for 30 min. The sample was lightly sonicated for 5 sec and centrifuged at 16,000 x g at 4 °C for 5 min. The resultant supernatant (~100 µl) was mixed with 900 µl of 100 mM Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub> (pH 7.5), and the protein concentration was determined with a BCA Protein Assay Kit (Thermo), with bovine serum albumin as the standard. A solution corresponding to 100 µg of protein was mixed with triethylammonium bicarbonate (TEAB) and TCEP, at final concentrations of 45 mM and 10 mM, respectively. The solution was incubated at 55 °C for 1 hr and then cooled to room temperature. A 15 µl aliquot of 375 mM iodoacetoamide was added to the solution, which was incubated at room temperature for 30 min under dark conditions. The protein was precipitated with chilled acetone. The pellet was dried, suspended in 100 µl of 100 mM TEAB, and digested with trypsin at 37 °C overnight. The resultant protein samples were labeled with a TMTduplex Isobaric Mass Tagging Kit (Thermo), according to the manufacturer's protocol. The samples were subjected to an LC-MS/MS analysis. The results were analyzed by Proteome Discovery (Ver. 1.4) with the MASCOT search engine (Ver. 2.4.1), referring to the NCBI\_Neisseria meningitidis (entry number: 453988), NCBI\_Neisseria meningitidis\_H44/76

(entry number: 6401) and NCBI\_Neisseria meningitidis\_MC58 (entry number: 4914) databases. The referring databases for the results are shown in the Table with square brackets. The cut-offs for the false discovery rate and the peptide rank for all analyzed data were <5% and 1, respectively. Since the protein expression ratios in the 3 independent experiments varied, the ratio value was divided by the average in each assay for normalization (shown in gray columns). Proteins with expression ratios of mutant (M) per wild type (W) strains (M/W) between 1.25 and 0.75 were eliminated, and proteins found in 2 out of 3 total independent experiments were chosen as reproducible results and shown in the table.
