

Supplementary Material

Supplementary Figure 1. Representative examples of conversion-specific, nested PCR of the *Nfe212* promoter from bisulfite converted single MEFs (Supplementary Fig.1a-1-9), from a pool of 100 cells (Supplementary Fig.1a-10) and from a negative control, i.e., water. To verify the specificity of the PCR for amplifying only converted DNA, 800 ng of unamplified, bisulfite-treated (Supplementary Fig.1b-1) and untreated (Supplementary Fig.1b-2), genomic DNA were subjected to the same nested PCR.

Supplementary Figure 2. Representative examples of a homozygously demethylating event (a), with only the thymine peak present in the Sanger sequence and a hemi-demethylating event (c) with both alleles (C/T) being represented. In (b) both alleles remain methylated. Of note, for homozygous demethylation we can never tell if this is not due to allele-specific amplification (see main text).

Supplementary Table 1. Primer sequences used for locus specific assays

Gene name	Primer sequence
Nfe212-FW External	5'-AGTGGTATAGTTTTAGTTTGTGGAGAGT -3'
Nfe212-RW External	5'-CCACCCAAAACCCAACAAAC-3'
