12

13 **Figure S1.** Extracellular views of cartoon renders of salmon louse aquaporins illustrating the ar/R  
 14 constriction residues (spacefill) that determine the molecular selectivity of the channel. Labels are  
 15 annotated as for Figure 1 in the main text.

16

17 **Figure S2.** Bayesian majority-rule mid-point rooted tree of an amino acid alignment of expressed  
 18 transcripts in Maxillipoda. The tree was inferred from 500,000 MCMC generations on 8,085 amino  
 19 acid sites. Posterior probabilities are shown at each node. Scale bar represents the number of amino  
 20 acid substitutions per site. Grey bars highlight species with N-terminal splice-variants

21

22 **Figure S3.** Bayesian majority-rule mid-point rooted tree of a codon alignment of the aquaporin  
 23 superfamilies in the Atlantic salmon and salmon louse. The tree was inferred from 1 million MCMC  
 24 generations on 57,075 nucleotide sites. Posterior probabilities of the codon/amino acid analyses are  
 25 shown at each node. Scale bar represents the number of nucleotide substitutions per site.

26

27 **Figure S4.** In the absence of cAMP, salmon louse Glp1\_v1 is non functional in *X. laevis* oocytes. (A)  
28 Osmotic water permeability ( $P_f$ ) of Glp1\_v1 without the addition of cAMP compared to water- and  
29 *glp\_3v2*-injected oocytes as negative and positive controls, respectively. (B) Immunofluorescence  
30 micrographs of paraffin sections of water- (Ctrl) and *glp1\_v1*-injected oocytes in the absence of cAMP  
31 probed with paralog-specific antisera followed by Cy3-labeled anti-rabbit IgG. Arrows point to the  
32 plasma membrane. Inset: Magnified region shows the retention of Glp1\_v1 (green) just below the  
33 oocyte plasma membrane.
