This file contains **Additional table ST5: Linear regression analysis of the correlations between residuals from the malaria antibody pairs.** Pairwise correlations between residuals were transformed to R-squared prior to analysis. The model was analysed as detailed in the table header with the study site included as a categorical variable orderedby the microscopically positive prevalence at each site (coeeficient = study site). Age groups were used as their categories (category [year range]_Years-old). Malaria antibody pairs are indicated in the left-hand column of the table. Kenya was not included as it only had a single age-group and Mali(Pongonon) was also not included because all individuals were selected for being malaria positive.
