

**Fig. S2.** Non-cirrhotic HCC patients with high levels of AROS expression have a shorter DFS for 5 yr. (A) AUC was 0.575. (B) AROS-high group showed significant shorter DFS time ( $P = 0.00495$ ). Thin lines, patients expressed higher levels of AROS ( $n = 71$ ); broken lines, patients expressed lower levels of AROS ( $n = 212$ ).
