eMethods

Patient enrollment: Patient data, including treatment history, smoking status, tumor histology, anatomical site, and stage were obtained through the University of Pittsburgh Head and Neck SPORE neoplasm virtual repository¹. The patient samples and clinical data were collected using protocols approved by the Institutional Review Boards of the University of Pittsburgh and the Broad Institute of MIT and Harvard.

DNA extraction and exome sequencing: Hematoxylin and eosin stained slides were cut from frozen tissue blocks and examined by a board-certified pathologist to select high-density cancer foci and ensure high purity of cancer DNA. Biopsy cores were taken from the corresponding frozen tissue block for DNA extraction. DNA was extracted and quantified using Picogreen dsDNA Quantitation Reagent (Invitrogen). DNA was stored at -20 degrees Celsius. Whole exome capture libraries were constructed from 100ng of DNA from tumor and normal tissue after sample shearing, end repair, and phosphorylation and ligation to barcoded sequencing adaptors. Ligated DNA was size selected for lengths between 200-350 bp and subjected to exonic hybrid capture using SureSelect v2 Exome bait (Agilent). The sample was multiplexed and sequenced using Illumina HiSeq technology for a mean target exome coverage of 85X in the tumor sample and 183X in the germline sample.

Sequence data processing: Exomes sequence data processing and analysis were performed using pipelines at the Broad Institute. A BAM file aligned to the hg19 human genome build was produced using Illumina sequencing reads for the tumor and normal sample and the Picard pipeline. The BAM was uploaded into the Firehose pipeline (<http://www.broadinstitute.org/cancer/cga/Firehose>) for managing intermediate analysis files executed by GenePattern.

© 2015 American Medical Association. All rights reserved.

Sequencing quality control: Sequencing data was incorporated into quality control modules in Firehose to compare the tumor and normal genotypes and ensure concordance between samples. Cross-contamination between samples from other individuals sequenced in the same flow cell was monitored with the ContEst algorithm².

Alteration calling, annotation, and prioritization: The MuTect algorithm was applied to identify somatic single-nucleotide variants in targeted exons³. Indelocator (<http://www.broadinstitute.org/cancer/cga/indelocator>) was applied to identify small insertions or deletions. Copy ratios were calculated for each hybrid capture bait by dividing the tumor coverage by the median coverage obtained in a set of reference normal samples⁴. The resulting copy ratios were segmented using the circular binary segmentation algorithm⁵. Alterations were annotated using Oncotator (<http://www.broadinstitute.org/cancer/cga/oncotator>), and heuristics were applied to nominate clinically and biologically relevant alterations for individual patient samples using PHIAL⁶. All alterations nominated by PHIAL were manually reviewed in the Integrated Genomics Viewer (IGV)⁷. In addition, all sequencing reads for *EGFR* were manually reviewed in IGV, including locations of known *EGFR* hotspot activating mutations⁸.

Human Papilloma Virus (HPV) Detection: Using *in situ* hybridization - An HPV pan-specific DNA probe (Dako, Wide Spectrum HPV DNA Probe Cocktail, Biotinylated) was applied to formalin-fixed paraffin-embedded tissue blocks from the patient tumor. This probe detects HPV subtypes 6, 11, 16, 18, 31, 33, 35, 45, 51, and 51. A tumor with punctuate nuclear staining is scored as HPV-positive.

Cell lines: HNSCC cell line CAL-33 was obtained from Dr. Gerard Milano (University of Nice, France), and FaDu cells were obtained from ATCC (Manassas, VA). The HSC-6 cell line (harboring endogenous *MAPK1*^{E322K} mutation) was a kind gift from Prof. Johji Inazawa (Tokyo Medical and Dental University, Japan). All cell lines were maintained in Dulbecco's Modified Eagle Medium (DMEM) supplemented with 10% fetal bovine serum (FBS) (Invitrogen, Carlsbad, CA), penicillin (100 U/ml)/streptomycin (100 µg/ml) at 37°C in a humidified atmosphere of 5% CO₂.

Retroviral Infection of HNSCC cells: Retroviruses were generated using the Platinum Retrovirus Expression Systems (Cell Biolabs, San Diego, CA) according to manufacturer's instructions. Briefly, Plat-A cells were transfected with 3 µg of retroviral vector carrying the gene of interest (pMXs-puro-EGFP as control, pMXs-puro-*MAPK1* WT, pMXs-puro-*MAPK1*^{E322K} mutant). Three days after transfection, fresh retroviruses (in the supernatant of the Plat-A cells) were collected by centrifugation at 1,500 rpm for 5 mins at 4°C. Cell debris was removed by filtering through a 0.45 µm syringe filter. Fresh retroviruses were used for infection of FaDu cells. FaDu cells were plated at 20% confluency in a T25 flask one day before infection. Infection of HNSCC cells was performed by adding 1.5 ml of retrovirus to the cells containing 2.5 ml of complete culture media. Then, 12 µl of polybrene (4 µg/µl, Sigma-Aldrich, St. Louis, MO) was added to the cells with gentle mixing. Cells were then incubated at 37°C and 5% CO₂ for an additional 48-72 hours, and the infection medium was replaced with fresh complete medium. Expression of the gene of interest and alteration of the signaling pathway was assessed by Western blotting.

MAPK1 siRNA Knockdown: HSC-6 cells were transfected with either MAPK1-targeting siRNA or control siRNA (catalog numbers SR303751C and SR30004, respectively,

Origene Technologies, Inc.) using siTran (Origene Technologies, Inc.) according to manufacturer's instructions. 48h after transfection, cells were transferred to 12-well plates and allowed to attach for 24h before erlotinib treatment and cell viability assessment.

Senescence Assay: Cells were treated with vehicle (DMSO) or erlotinib (0.5 μ M and 5 μ M) for 48h after which b-galactosidase activity at pH 6 was detected in senescent cells by light microscopy (100x) following staining using the senescence staining kit (Cell Signaling Technology, USA). Number of senescent cells and total number of cells per field were analyzed for ≥ 5 fields for each cell type and treatment condition. Average percent of senescent cells from a representative of 3 independent experiments is presented.

Trypan Blue Exclusion Assay: Cells were treated with vehicle (DMSO) or erlotinib (0.5 μ M and 5 μ M) for 48h then harvested by trypsinization for cell counting. Viable cells upon trypan blue staining (Invitrogen, Carlsbad, CA) were counted under light microscope. Triplicate wells were counted each time. Cumulative data from 2 independent experiments were analyzed for statistical significance.

Western blotting: Primary antibodies for phospho-p42/44-MAPK, p42/44-MAPK and phospho-EGFR(Y1068) were from Cell Signaling Technology, Inc. (Boston, MA), while EGFR antibody was obtained from BD biosciences (San Jose, CA). Anti-tubulin antibody was from Abcam (Cambridge, MA) and secondary antibodies from BioRad (Hercules, CA).

eFigure 1. MAPK1 and Erlotinib Sensitivity in HNSCC Cell Lines

Representative pictures of senescence staining of stably transfected FaDu cells. FaDu-Vector, FaDu-MAPK1^{WT} and FaDu-MAPK1^{E322K} were stained for β -galactosidase activity at pH 6 following 48h erlotinib treatment. Staining was detected by light microscopy (pictured at 100x).

eFigure 2. Expression of *MAPK1*^{E322K} Increased Erlotinib Sensitivity in HNSCC Cells

Stably transfected FaDu cells, FaDu-Vector, FaDu-*MAPK1*^{WT} and FaDu-*MAPK1*^{E322K}, were assessed for viability as measured by vital dye exclusion assay following 48h erlotinib treatment. Viability presented relative to vehicle treated vector transfected cells (** denotes $p < 0.005$; t-test).

eFigure 3. Erlotinib Sensitivity Was Abrogated by ERK2 Knockdown in HSC-6 (*MAPK1*^{E332K}) Cells

(A) siRNA targeting MAPK1 (ERK2) resulted in reduced ERK2 protein expression and (B) significantly reduced HSC-6 growth inhibition in response to 48h treatment with 5 μ M erlotinib as measured by vital dye exclusion assay (** denotes $p < 0.005$; t-test). Viability data are presented relative to parental HSC-6 cells without erlotinib treatment.
