1. Supplemental figures

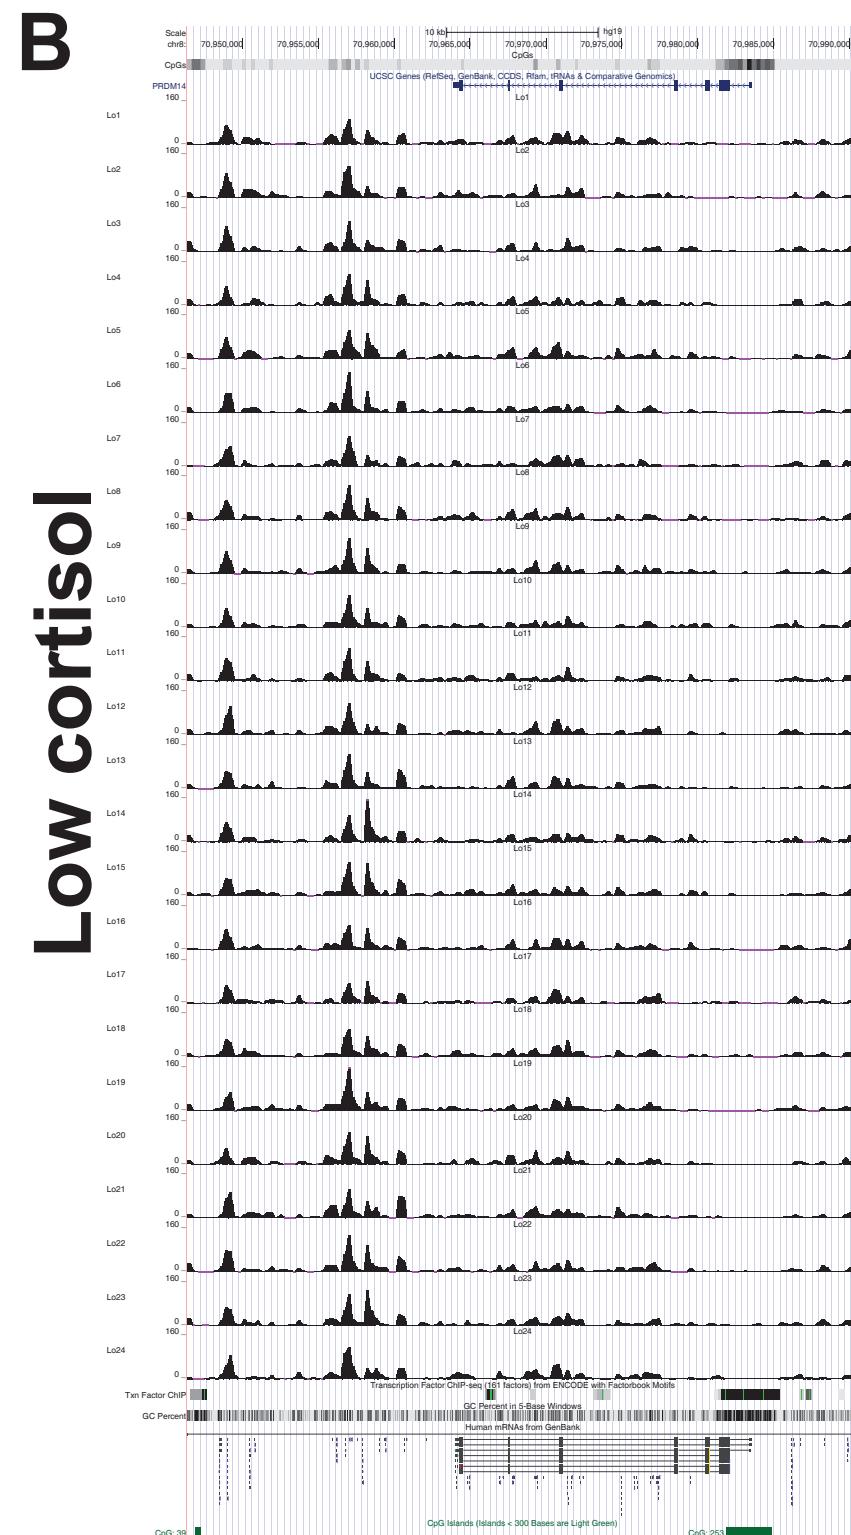

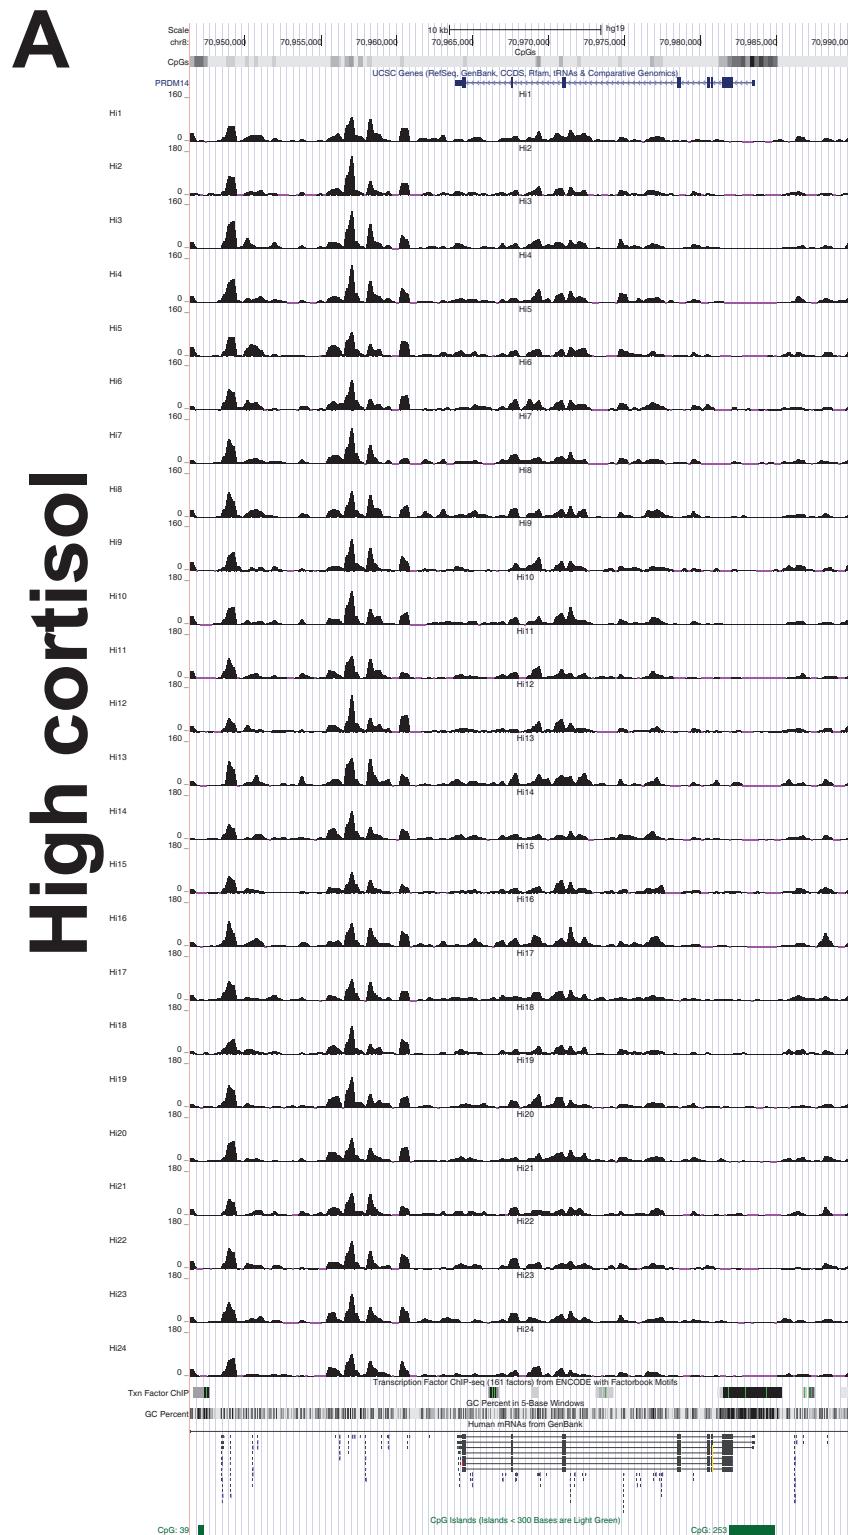

Fig. S1. Individual methylation profiles over the *PRDM14* gene. DNA methylation was measured in 300 bp windows. Top track shows relative CpG content in each window. For every methylation profile the Y-axis shows number of read counts, while the X-axis shows the position on chromosome 8 in bp. Graphs were generated and downloaded from UCSC genome browser custom tracks.

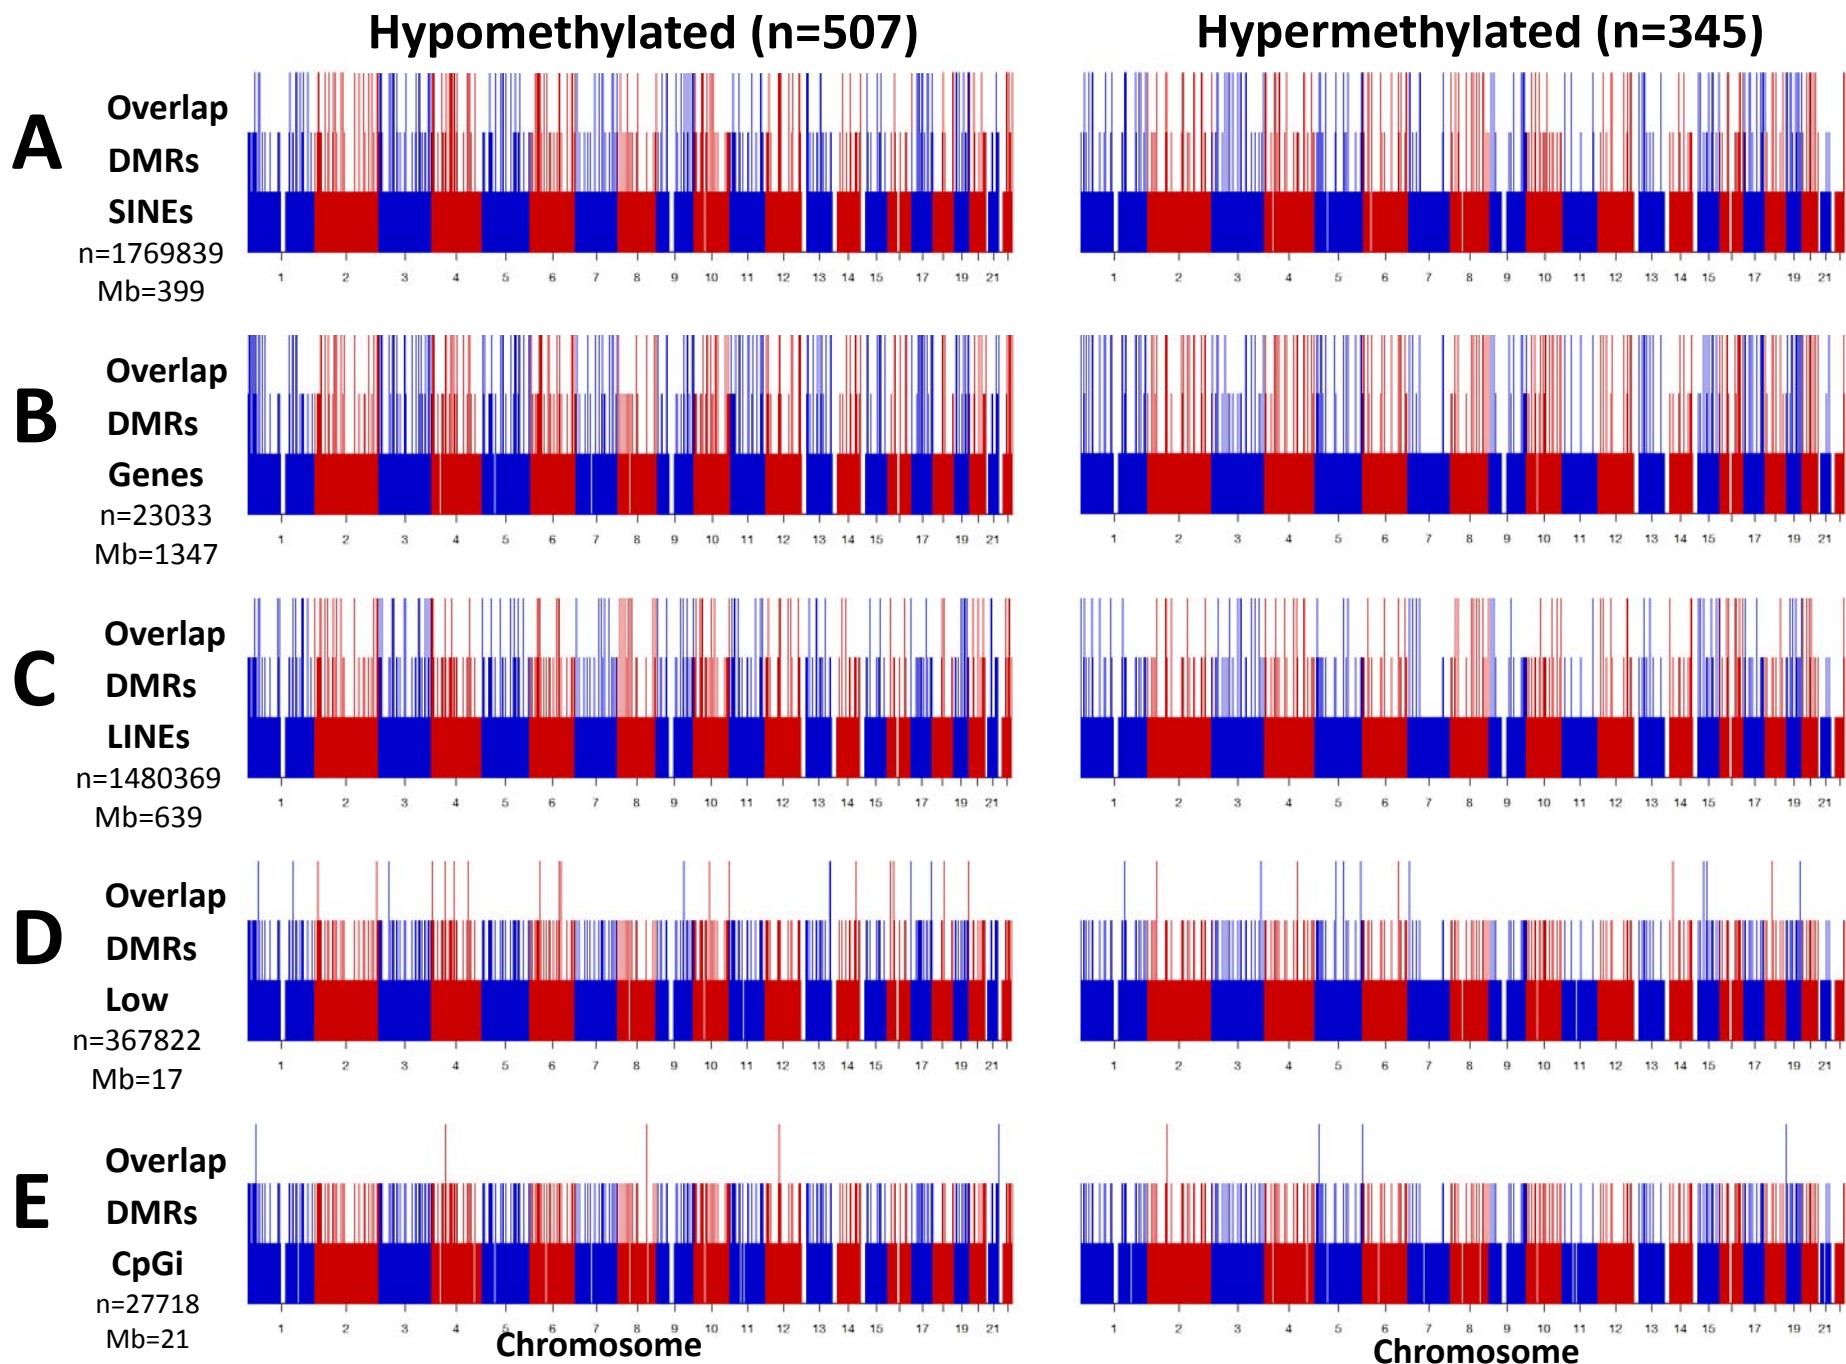

Fig S2. Overlaps between DMRs and selected genomic features. Colors divides chromosomes. SINE/LINE = Short/Long Interspersed Nuclear Element. Low = Low complexity DNA. CpGi = CpG islands. Mb = Coverage in megabases.

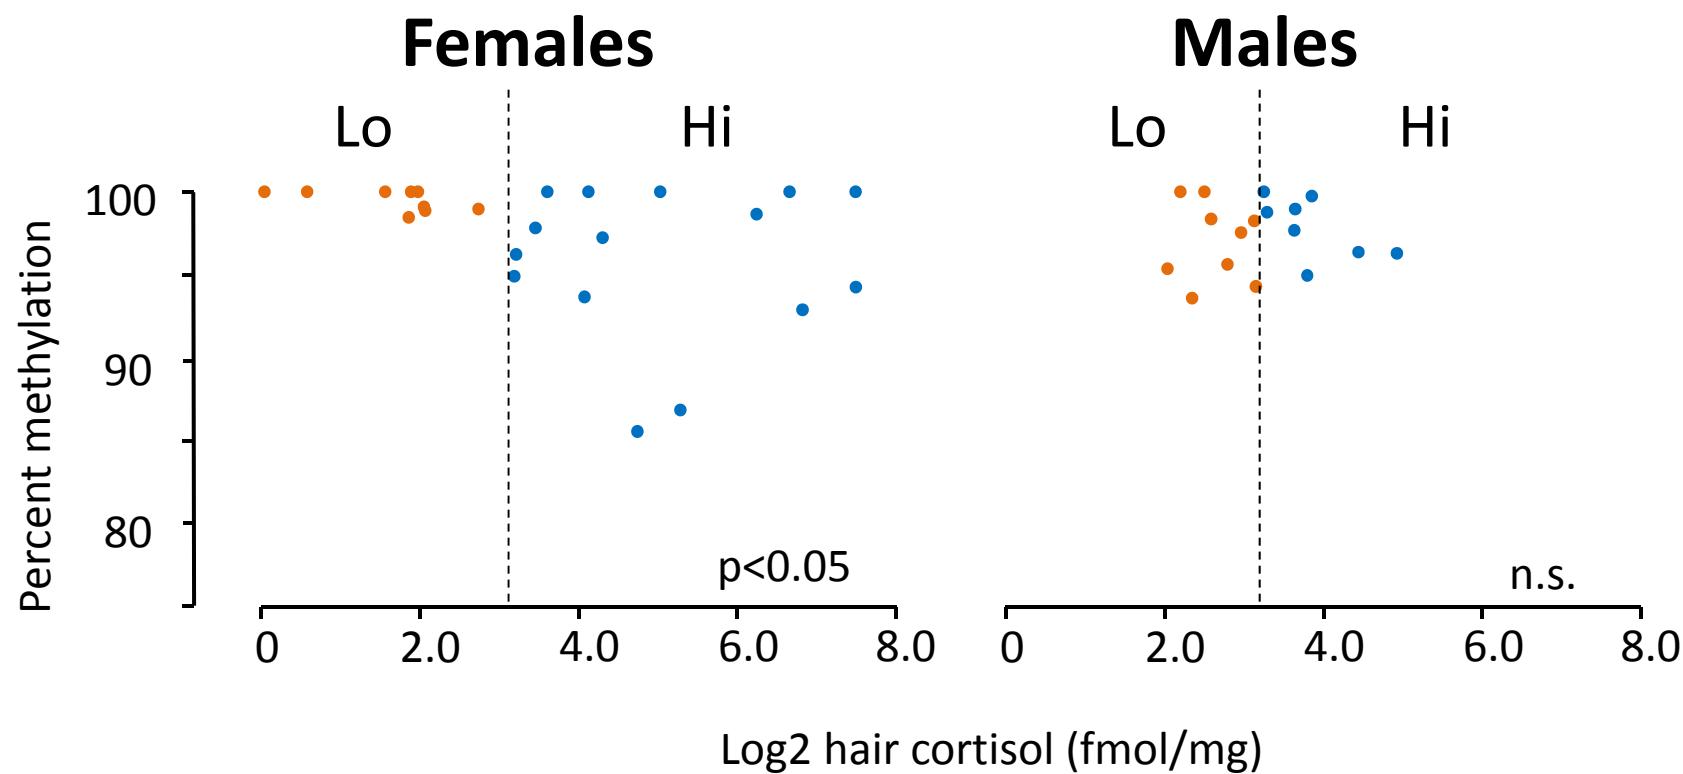

Fig S3. Bisulfite pyrosequencing results for the *BRCA1* gene. Blue represents high and red low hair cortisol children. P-value indicates results of a Mann-Whitney U test.

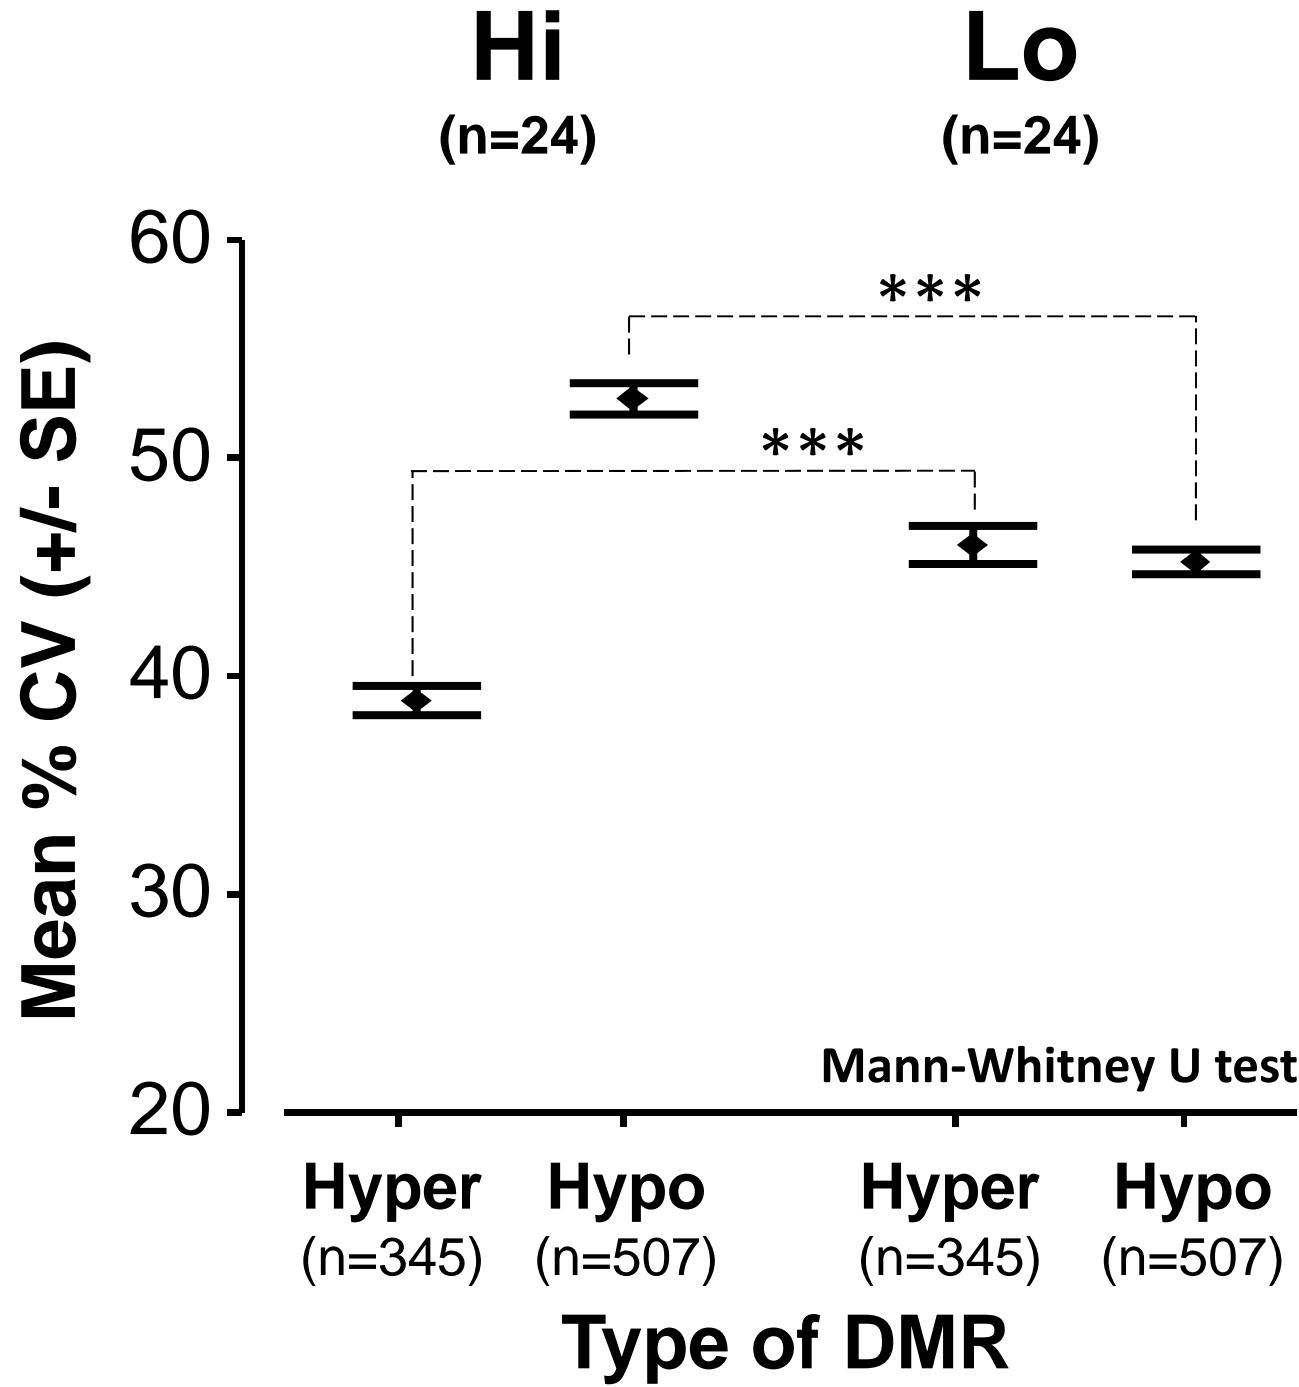

Fig S4. Comparison of the variation in DMR methylation between Hi and Lo, as measured by the Coefficient of Variation (CV). Hypo-methylated DMRs show more variation, while hypermethylated DMRs show less variation in Hi compared to Lo, where Lo is more stable across all DMRs. CVs were calculated by using the read counts of individual DMRs within each group (Hi/Lo), while standard errors (SE) were derived from the means of the hypo- and hypermethylated CVs respectively.

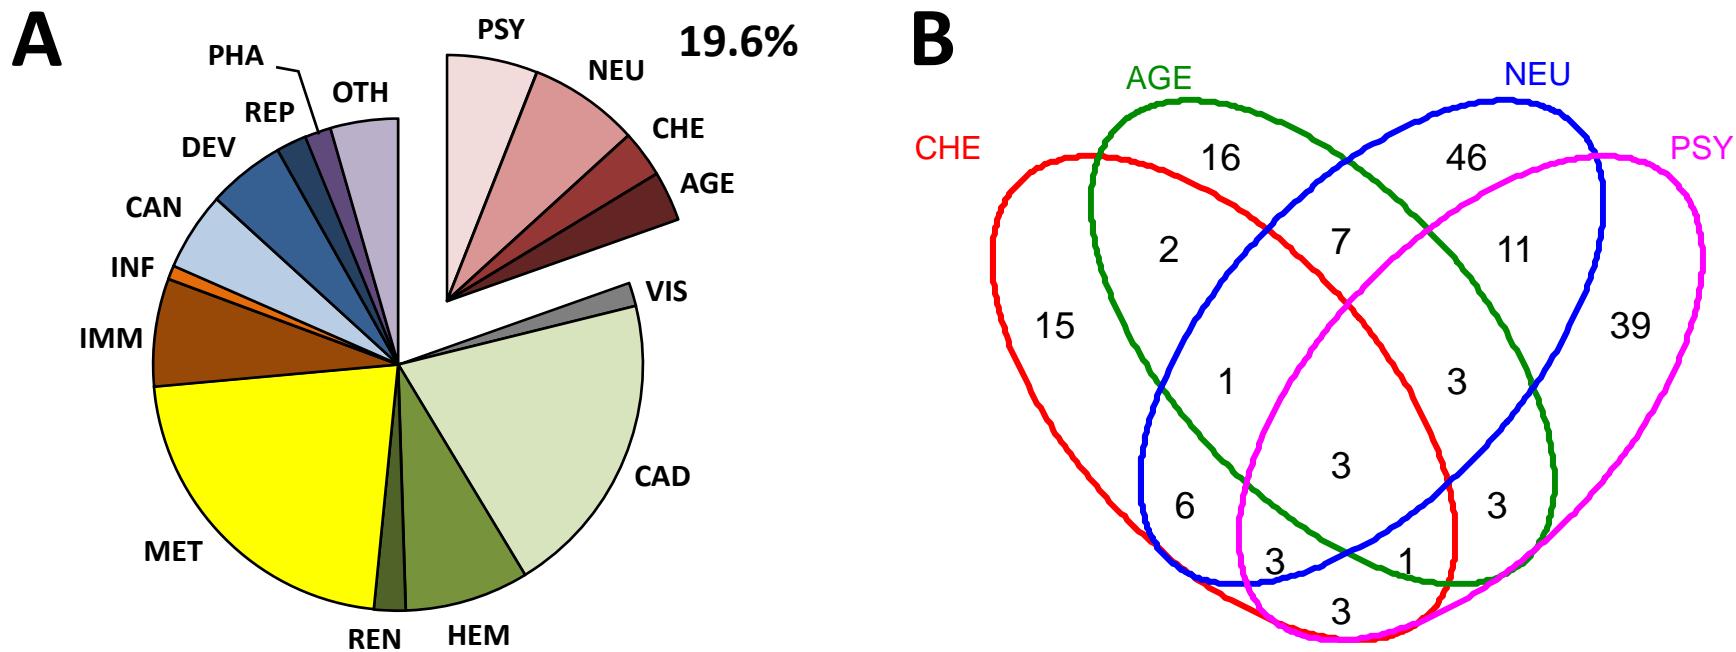

Fig S5. Raw frequencies of disease class representation and evidence for neuropsychiatric genes within the AGE class. (A) Circle diagram shows non-normalized proportions of disease classes within the $p<0.0001$ DMR associated genes. Note that MET and CAD are both heavily affected by publication bias containing more than 15 000 and 10 000 gene associations respectively, compared to REP and PHA that contains less than 600. Thus, normalizing with total number of listed genes within each class is appropriate (Fig. 4B in main article). (B) Venn diagram showing gene overlaps between four disease classes. Note that the majority of PSY and NEU disease genes do not overlap, while most genes associated with AGE diseases overlap with PSY, NEU and CHE associated diseases/disorders. PSY=Psychology, NEU=Neurological, CHE=Chemical dependence, VIS=Vision, AGE=Aging, CAD=Cardiovascular, HEM=Hematological, REN=Renal, MET=Metabolic, IMM=Immune, INF=Infection, CAN=Cancer, DEV=Development, REP=Reproduction, PHA=Pharmacogenomic, OTH=Other.

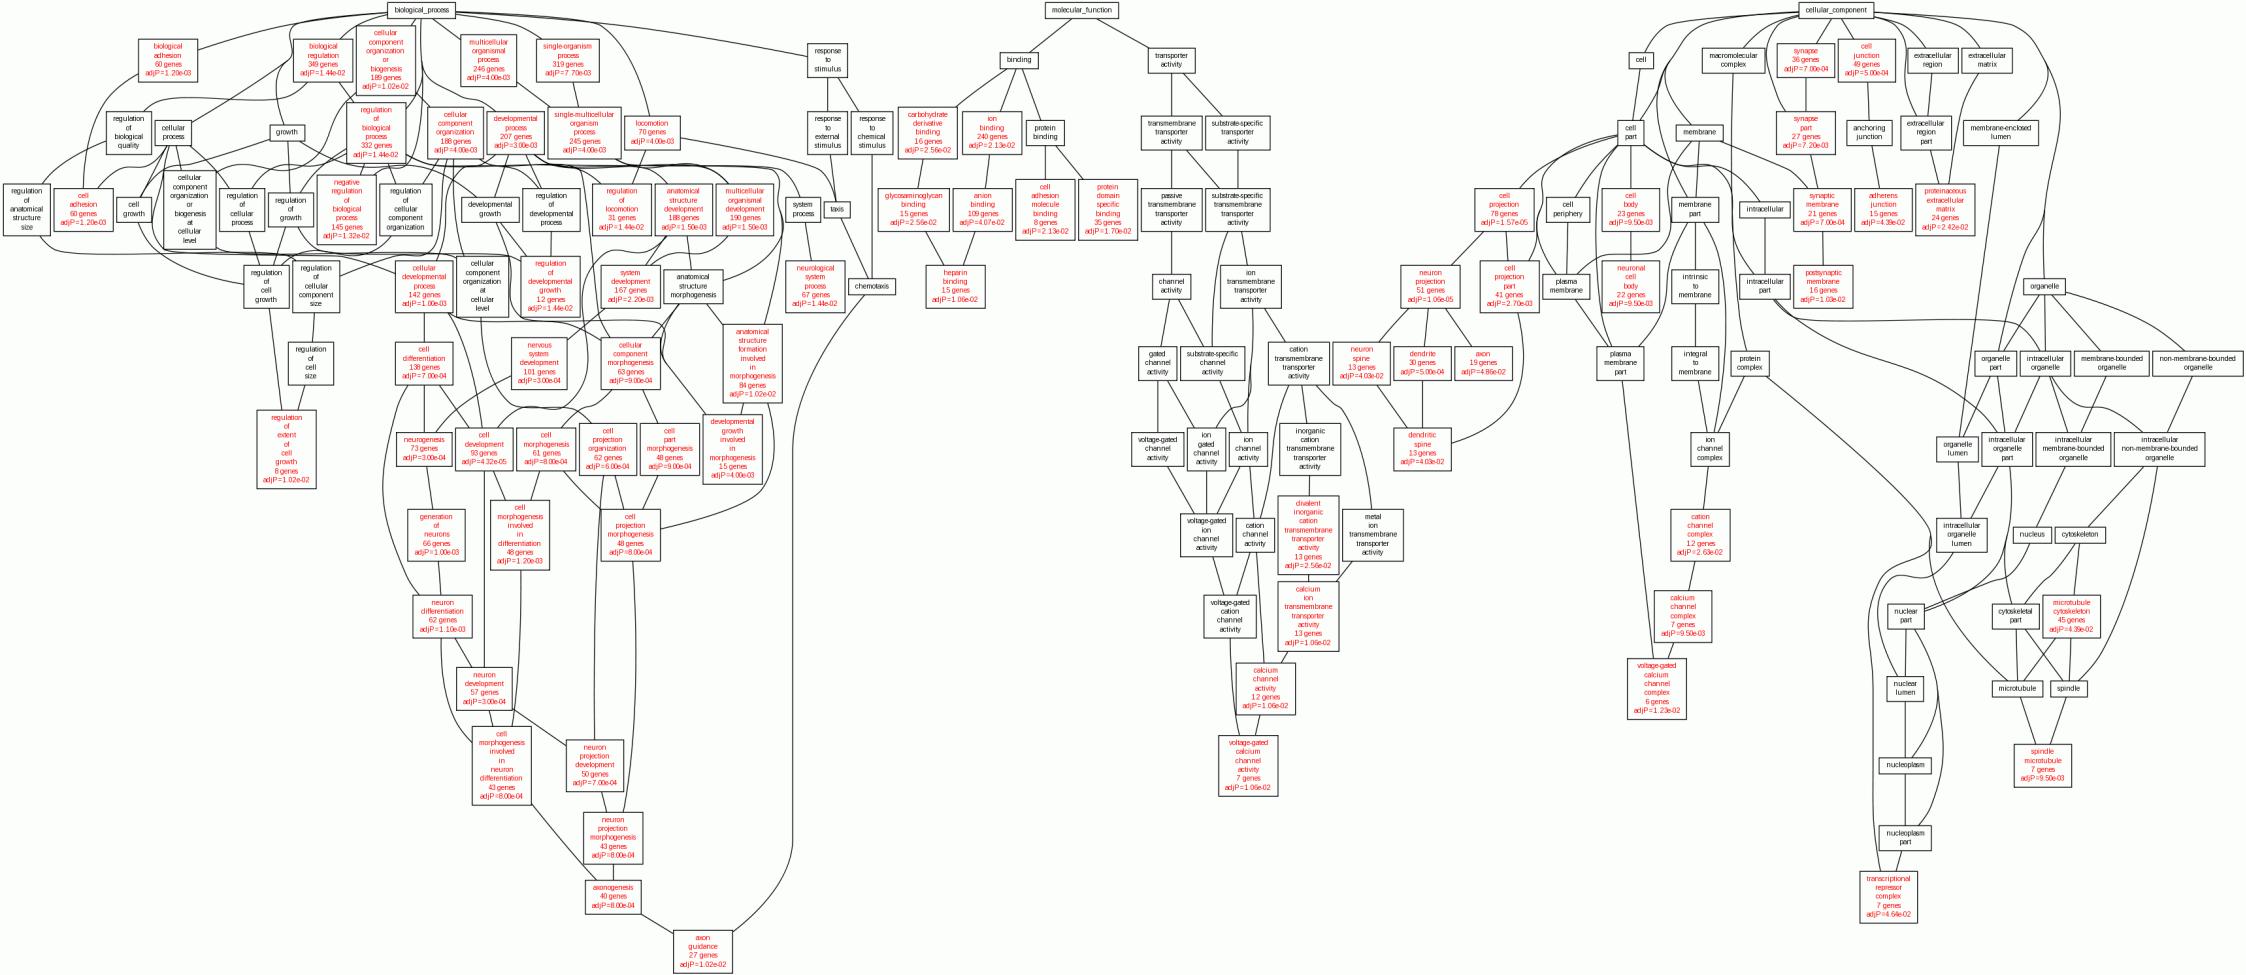

Fig S6. Gene ontology tree showing significant GO term enrichments within the $p < 0.0001$ DMR associated genes. Red indicates significant enrichments ($p < 0.05$ FDR adjusted) with at least 5 genes.

ZNF263

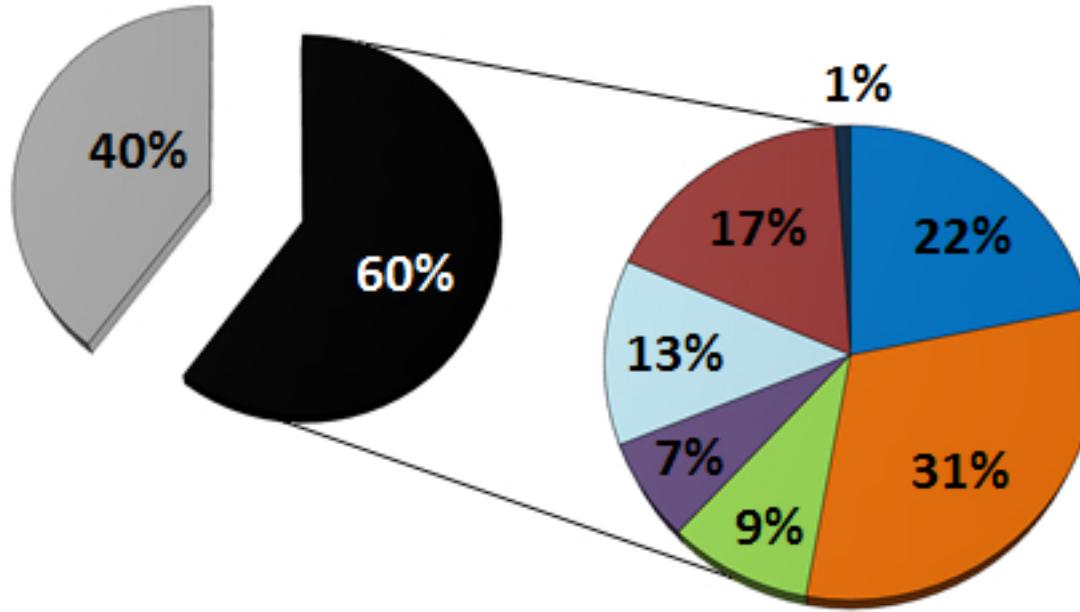

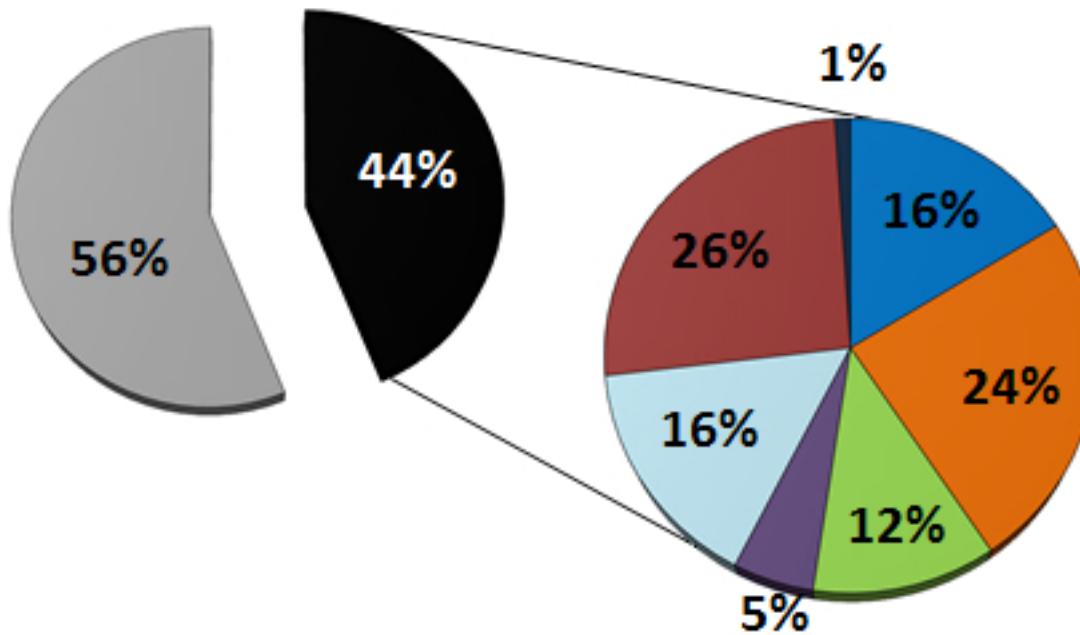

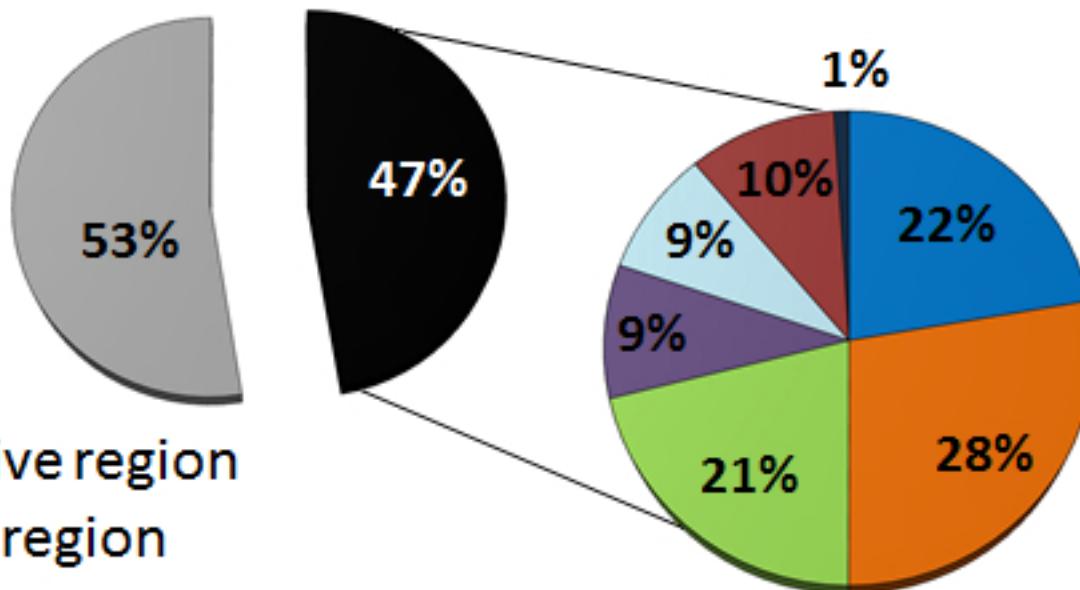

Fig S7. Candidate Zinc finger binding to repetitive sequences. ZNF263 tend to bind repeat regions, especially SINE's, more often than EGR1 and SP1. Circle diagrams shows percent occurrence of repeats in transcription factor (TF) binding regions for three candidate TF's (ZNF263, EGR1, SP1) that were associated with hypomethylated regions in Hi children. TF regions were adopted from previous Encode ChIP-seq experiments, while repeat data were downloaded from the repeatmasker database.

EGR1

SP1

- Repetitive region
- Unique region
- LINEs
- SINEs
- LTRs
- DNA transposons
- Low complexity
- Simple repeats
- Other

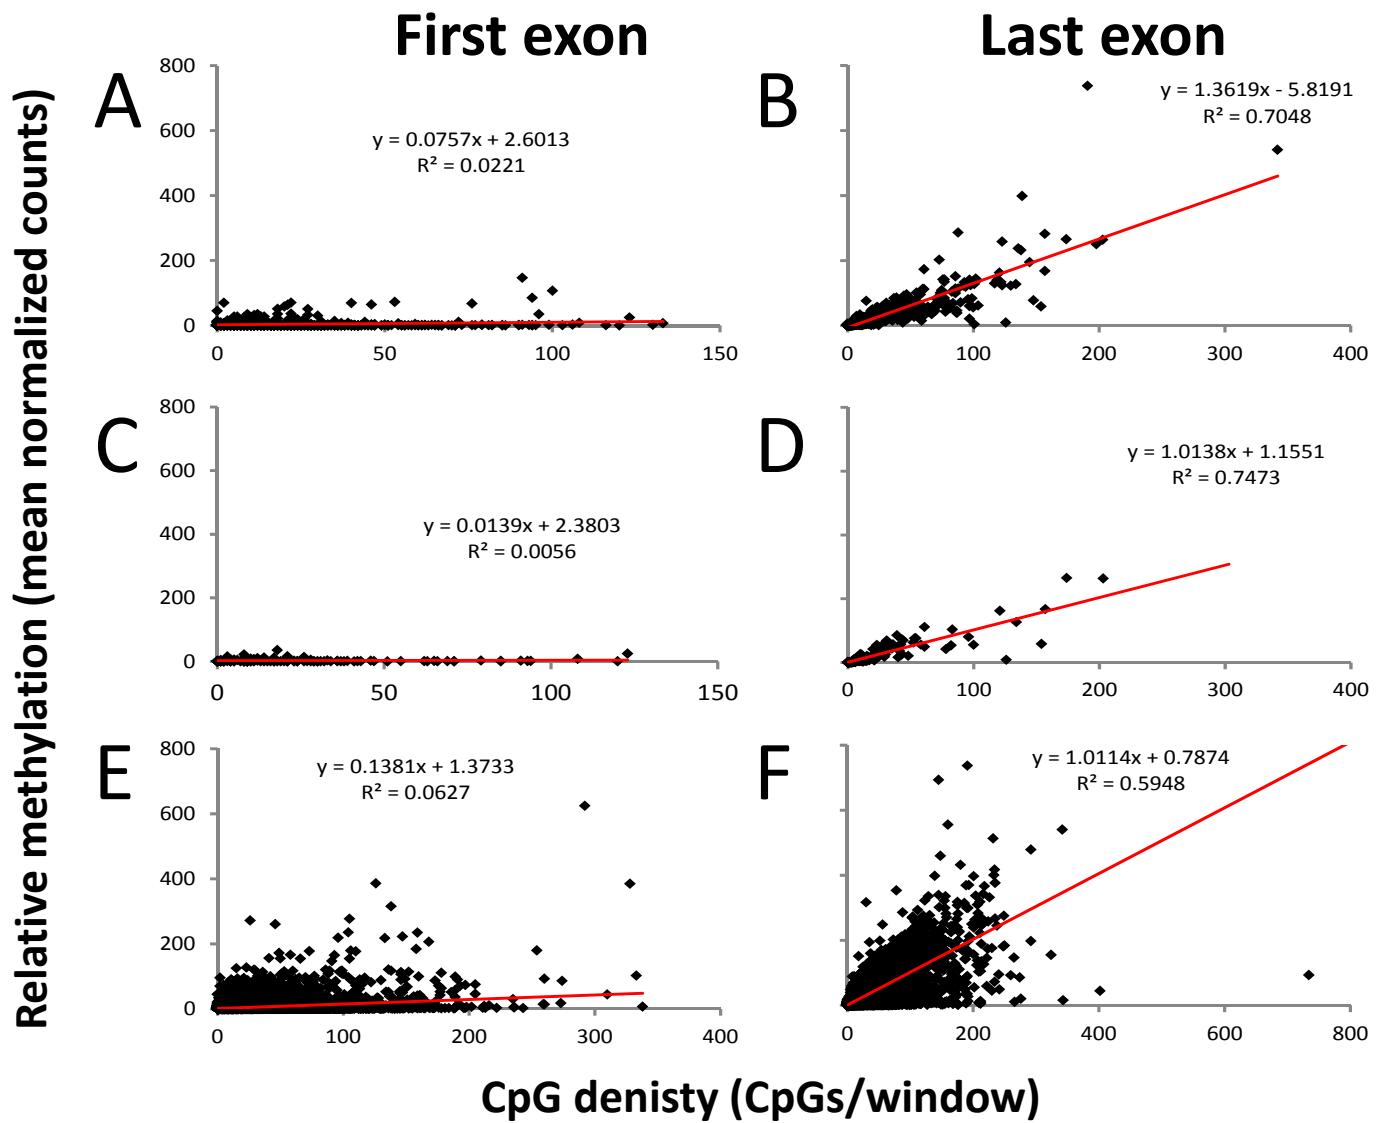

Fig S8. First exon versus last exon methylation relative to number of CpG's. Individual dots represent mean per individual exon across all children ($n=48$). **A** and **B** plots show genes closest to differentially methylated regions (DMR's, $p<0.0001$) between high and low hair cortisol children. **C** and **D** shows the subset of DMR's associated genes that previously been associated with disease. **E** and **F** shows all first and last exons, genome wide. Included are only genes with at least three exons.
