

THE LANCET

Supplementary appendix

This appendix formed part of the original submission and has been peer reviewed. We post it as supplied by the authors.

Supplement to: Global Burden of Disease Study 2013 Collaborators. Global, regional, and national incidence, prevalence, and years lived with disability for 301 acute and chronic diseases and injuries in 188 countries, 1990–2013: a systematic analysis for the Global Burden of Disease Study 2013. *Lancet* 2015; published online June 8. [http://dx.doi.org/10.1016/S0140-6736\(15\)60692-4](http://dx.doi.org/10.1016/S0140-6736(15)60692-4).

Appendix to Global, regional, and national incidence, prevalence, and YLDs for 301 acute and chronic diseases and injuries for 188 countries, 1990-2013: a systematic analysis for the Global Burden of Disease Study 2013

This appendix provides further methodological detail, supplemental figures, and more detailed results for incidence, prevalence, and years of life lived with disability. The appendix is organised in broad sections following the structure of the main paper.

Appendix A: Methods

Comorbidity Simulation

A.1. Simulation inputs

The two components necessary for the computation of YLDs, prevalence of each disease sequelae and disability weights, are the two inputs into COMO. The prevalence values are primarily produced using DisMod-MR. The process for computing disability weights is described in Solomon et al.¹

A.2. Methods

The micro-simulation, as performed for a single estimation of an age-sex-country-year, can best be represented as a four-step process. First, simulants are exposed to independent probabilities of having each sequelae, where the probability is equal to the prevalence estimate. For each simulant, the probability of having a disease sequela is equal to the estimated prevalence from that draw from the uncertainty distribution. Each simulant is determined to have or not have the disease sequelae based on a draw from the binomial distribution. From this simulation, simulants end up having from none to multiple disease sequelae. Second, the disability weight for each simulant is estimated based on the disease sequelae that they have acquired. The formula for the cumulative disability weight for a simulant is one minus the multiplicative sum of one minus each disability weight present:

$$\text{Simulant } DW_l = 1 - \prod_{k=i}^j (1 - DW_k)$$

where the DW_k is the disability weight for the k^{th} disease sequelae that the simulant l has acquired. Once the simulant disability weight is computed, the disability weight attributable to each sequela for the simulant is calculated using the following formula:

$$ADW_{lk} = \frac{DW_k}{\sum_{k=i}^j DW_k} * \text{Simulant } DW_l$$

Where ADW_{lk} is the attributable DW for disease sequelae k in simulant l ; DW_k is the disability weight for disease sequelae k , and simulant DW_l is the disability weight for simulant l from the combination of all sequelae that they have acquired. This formula apportions the overall simulant disability weight to each condition in proportion to the disability weight of each condition in isolation.

Finally, YLDs per capita in an age-sex-country-year are computed by taking the sum of the attributable disability weights for a disease sequela across simulants.

$$\text{YLD Rate}_k = \frac{\sum_{l=1}^n ADW_{lk}}{n}$$

The actual number of YLDs from disease sequela k in an age-sex-country-year is then computed as the YLD rate k times the appropriate age-sex-country-year population.

A.3. Comorbidity Simulation

The final stage in the estimation of YLDs is a micro-simulation, which adjusts for comorbidity. We refer to this micro-simulation process as “COMO”. The purpose of COMO is to take into account comorbidity in the computation of disease-sequelae specific YLDs. COMO is performed separately for each age-sex-country-year, exposes a synthetic population of 40,000 individuals to the risk of contracting each disease sequelae. This process is summarised below and is described in more detail in Vos et al.²

Appendix B: DisMod-MR 2.0

B.1. Changes between DisMod-MR 1.0 and 2.0

DisMod-MR was developed for the GBD 2010 study to address the challenges in estimating the prevalence of non-fatal health outcomes and risk factor exposures. The information gathered by systematic reviews of published studies, grey literature sources, and survey data varied tremendously for each outcome of interest in terms of the volume of data, methods used to collect the data, geographical and temporal coverage, and the type of epidemiological parameter. The goal was to find the true variation in the occurrence of diseases and risk factors for every country and over time.

Estimates of prevalence (or any of the other epidemiological parameters of interest: incidence, remission, duration and risk of mortality) for the same populations often varied by much more than would be expected based on sampling error. Differences in data collection methods such as sampling design, case definitions, measurement instruments, and implementation issues contributed to large non-sampling error. There are two approaches to deal with this heterogeneity. One could set criteria for the optimal measurement of each disease parameter of interest and include only those studies that meet that high standard. This would make measurements comparable but would leave out the vast majority of information available. In GBD, the preferred approach is to make use of all available data that meets a minimum standard of acceptable quality and address major differences in measurement methods by adjusting data for any systematic bias introduced by a study quality characteristic relative to a chosen reference value. This was done by identifying for each disease or risk factor exposure the important study characteristics that can help explain the variation in measurements and flag data points that deviate from the chosen, optimal, reference value with a covariate. DisMod-MR then estimated a coefficient for each chosen study covariate and adjusted the data accordingly.

To help make estimates for countries and time periods for which little or no data were available, DisMod-MR would predict based on country characteristics and random effects on super-region, region and country. For this purpose a database of country covariates for 93 topic areas and 242 variants thereof was created. Missing data were filled in using Gaussian process or space-time regression methods to ensure a complete set of values for each covariate for every country and every year from 1980 to present. If no country covariates were specified and no data were available, a country estimate would revert to the average of a region, super-region or the world.

DisMod-MR dealt with any specification of age ranges by which data were available to produce estimates by the 20 standard GBD age groups. It also allowed the user to add strong prior knowledge on the age at onset or age pattern of prevalence or incidence such as restricting the occurrence of pre-menstrual syndrome to fertile ages or stipulating that there are no cases of Parkinson's disease before age 30. All these functions were new in DisMod-MR compared to earlier DisMod version used in previous GBD studies which required an analyst to choose one particular data source for a given disease parameter rather than being able to evaluate all available data. Hence the tool was renamed DisMod-MR, the suffix indicating the important meta-regression component. DisMod-MR also accommodated the main functionality of the earlier DisMod tools, i.e. confronting the data from different disease parameters and forcing consistency between these based on differential equations that determine the flow of cases in a stable population between those disease-free and prevalent cases of disease (through incidence or remission) and those in either category that die from other causes (other-cause mortality) and the disease of interest (cause-specific mortality).

To accommodate all functions, DisMod-MR was designed as a Bayesian meta-regression tool using a generalised negative binomial model with fixed effects on age, study and country level covariates as well as random intercepts for country, region and super-region. Greater detail on DisMod-MR has been published in a web-appendix to the paper on non-fatal health outcomes in the GBD 2010.

While DisMod-MR successfully addressed many of the major challenges in the estimation of non-fatal health outcomes and risk factor exposures it had a number of drawbacks which we have tried to solve for GBD 2013 by creating an updated version of the tool, DisMod-MR 2.0. The biggest drawback was the computing time required. Each disease model needed to run between 4 and 24 hours on a large computer cluster to produce results for all countries and three time periods (1990, 2005, and 2010). Moreover because of computational constraints a decision

had to be made to restrict the consistency checks at the level of 21 regions only. To make country estimates, the relevant fixed effects on study and country covariates and the random effects for each country were applied. While this produced defensible estimates of prevalence it did not guarantee coherence between prevalence and other disease parameters such as incidence and excess mortality rates at the country level.

The code for DisMod-MR 2.0 was rewritten and optimised to run up to 50 times faster than DisMod-MR. We decided to shift to an offset log-normal rather than a negative binomial model as this is easier to implement and predictive validity tests carried out in DisMod-MR indicated that the statistical properties of the two types of models were at least equivalent.

The much faster running time of the core computational engine in DisMod-MR 2.0 allowed us to better evaluate all the data through a geographical cascade of four levels. At first, all the available global data are evaluated to estimate the fixed effects on age, sex, study level, and country level covariates as well as a first pass at estimating the random effects for countries, regions and super-regions. The outputs of the global level analysis are then used as priors for the next super-region level of the cascade. A single age pattern for both sexes and all years of interest is created with uncertainty bounds. All data points that are marked as pertaining to both sexes or flagged with a covariate for a study characteristic (e.g. a less than optimal case definition or a low response rate) are adjusted at this stage to reflect what the likely value would have been if the study had specified sex and/or used the reference study characteristic. The data are also split up between super-regions and, optionally, by time period and sex. Using the global prior and the adjusted data, values for each super-region are re-estimated using the same core computational engine. While there is flexibility to re-assess fixed effects on sex or study level covariates at this level, the default option is to adjust the data by the sex and study-level covariates after the global level fit only. At each successive level of the cascade the fixed effects on country-level covariates are re-evaluated and centered on the average of values for the countries that make up a super-region or region. Similarly, random effects are re-evaluated for just the countries in a given geography. It logically follows that no fixed or random effects are re-evaluated at the country level. After fitting the model to each of the super-regions, the results are fed as priors to the region-specific fits and, finally, region fits are used as a prior when modelling a country's results for a particular time period.

A new interface was created to draw relevant data for each disease, sequela, or risk factor to be modelled, to apply all the default and optional settings, and to visualise results. The analyst has a lot of choice to set model parameters to suit any given disease or risk factor of interest. There is a setting to define the age mesh point at which DisMod-MR 2.0 does its calculations. The default setting is to use 21 age mesh points that define the 20 GBD standard age groups. For each study-level and country-level covariate the analyst can set a reference value and upper and lower values for the coefficients. The inclusion of cause-specific mortality rates by age and sex from GBD's mortality estimates is optional. An alternative method of informing a model with mortality data is by using the log of the age-standardised mortality rate as a country-level covariate. Other examples of the basic settings include a value for the parameter that determines the amount of smoothing over the age curve and is denoted by Greek letter 'xi' (ξ); the value of the offset for the lognormal ('eta' or η) for which the default setting is at one per cent of the median of available data values for a parameter or 0.0001 in case there are no data for that parameter; and a range of values for the parameter 'zeta' (ζ) that determines how much 'noise' the analyst allows DisMod-MR 2.0 to estimate for a parameter. The latter function is useful to the analyst. When DisMod-MR 2.0 estimates zeta close to the upper threshold it indicates there is a lot of noise in the data or it may be an indication that there are data entry errors that deserve attention.

B.2 DisMod-MR 2.0 likelihood estimation

Analysts have the choice of using a Gaussian, log-Gaussian, Laplace or Log-Laplace likelihood function in DisMod-MR 2.0. The default log-Gaussian equation for the data likelihood is:

$$-\log[p(y_j|\Phi)] = \log(\sqrt{2\pi}) + \log(\delta_j + s_j) + \frac{1}{2} \left(\frac{\log(a_j + \eta_j) - \log(m_j + \eta_j)}{\delta_j + s_j} \right)^2$$

where, y_j is a 'measurement value' (i.e. data point); Φ denotes all model random variables; η_j is the offset value, eta, for a particular 'integrand' (prevalence, incidence, remission, excess mortality rate, with-condition mortality rate,

cause-specific mortality rate, relative risk or standardised mortality ratio) and a_j is the adjusted measurement for data point j , defined by:

$$a_j = e^{(-u_j - c_j)} y_j$$

where u_j is the total ‘area effect’ (i.e. the sum of the random effects at three levels of the cascade: super-region, region and country) and c_j is the total covariate effect (i.e. the mean combined fixed effects for sex, study level and country level covariates), defined by:

$$c_j = \sum_{k=0}^{K[I(j)]-1} \beta_{I(j),k} \hat{X}_{k,j}$$

with standard deviation

$$s_j = \sum_{l=0}^{L[I(j)]-1} \zeta_{I(j),l} \hat{Z}_{l,j}$$

where k denotes the mean value of each data point in relation to a covariate (also called x-covariate); $I(j)$ denotes a data point for a particular integrand, j ; $\beta_{I(j),k}$ is the multiplier of the k^{th} x-covariate for the i^{th} integrand; $\hat{X}_{k,j}$ is the covariate value corresponding to the data point j for covariate k ; l denotes the standard deviation of each data point in relation to a covariate (also called z-covariate); $\zeta_{I(j),l}$ is the multiplier of the l^{th} z-covariate for the i^{th} integrand; and δ_j is the standard deviation for adjusted measurement j , defined by:

$$\delta_j = \log[y_j + e^{(-u_j - c_j)} \eta_j + c_j] - \log[y_j + e^{(-u_j - c_j)} \eta_j]$$

Where m_j denotes the model for the j^{th} measurement, not counting effects or measurement noise and defined by:

$$m_j = \frac{1}{B(j) - A(j)} \int_{A(j)}^{B(j)} I_j(a) da$$

where $A(j)$ is the lower bound of the age range for a data point; $B(j)$ is the upper bound of the age range for a data point; and $I(j)$ denotes the function of age corresponding to the integrand for data point j .

B.3 Model fit metrics: R^2

A variant of the coefficient of determination (R^2) has been computed for each of the sequelae prevalence models to measure how closely each model fits its input data. This metric compares the variance of the model’s errors with the total variance of the input data. It is formulated such that as a model’s errors approach zero (i.e. as the model approaches a perfect fit to the data), the R^2 metric approaches 1.

As described in the main text, the prevalence modelling process accounts for the uncertainty of the input data. The models are expected to be better predictors of more certain data. To account for this uncertainty in computing R^2 , the errors are weighted by the inverse of the standard error of the input data. Further, as the prevalence modelling is conducted in log space, the R^2 metric is also computed in log space. The formulation of R^2 used in this analysis is:

$$1 - \frac{\sum_i \frac{1/s}{\|1/s\|_i} \times (\ln(y_i) - \ln(\hat{y}_i))^2}{\sum_i \frac{1/s}{\|1/s\|_i} \times (\ln(y_i) - \overline{\ln(\mathbf{y})})^2}$$

Where:

- \mathbf{y} is the data vector, of length N
- y_i is the i^{th} data point
- \hat{y}_i is the predicted value for the i^{th} data point
- \mathbf{s} is the vector of standard errors of the data points (transformed into log space using the delta method)
- $\frac{1/s}{\|1/s\|_i}$ is the inverse of the standard error of the i^{th} data point, normalised

Appendix Table A.4 includes results for R^2 as well as descriptions of model strategy by cause and sequela.

B.4 DisMod-MR 2.0 validation and RMSE calculation

Model validity is assessed by performing cross-validation. In this procedure, a DisMod-MR 2.0 model is estimated with 30% of the incidence data and 30% of the prevalence data excluded at random. The data, both the excluded data and the data left in, are cross-walked for inter-study consistency between estimates. Then, the resulting model fit is compared to the adjusted (by study level covariate effects in the analysis) excluded data and the out-of-sample correlation, root mean squared error (RMSE), the standard deviation of the residuals, and coverage for incidence and prevalence separately. The equation for calculating RMSE is below:

$$\sqrt{\frac{\sum_{i=1}^n (\ln(\hat{y}_i) - \ln(\hat{y}_i))^2}{n}}$$

Where n is the total number of excluded data points, \hat{y}_i is the adjusted data point, and \hat{y}_i is the prediction for the same country, year, age, and sex as adjusted data \hat{y}_i . Coverage was assessed as the proportion of data that lie within the 95% uncertainty interval for data predictions. For out-of-sample data, a coverage of 95% would be expected. A coverage larger than this would indicate that a model's uncertainty intervals are too large, while an out-of-sample coverage less than 95% would indicate uncertainty intervals that are too small.

Due to computational time required for the analysis, we chose 10 models at random to assess external validity. Appendix Table 7 contains the RMSE and the uncertainty interval coverage both in and out of sample for the ten DisMod-MR 2.0 models. For all cases, the RMSE out-of-sample was quite comparable to the in-sample RMSE. Uncertainty interval coverage was over 90% for nearly all cases; uncertainty interval coverage for the COPD model was somewhat lower in the 80% range.

Appendix C: Non-fatal Cancer Outcomes

C.1 Survival curve boundaries

In both the GBD 2010 and the GBD 2013, we used the access to care variable to scale survival for each cancer by country and sex between an upper and a lower boundary in order to calculate the cohort survival for each cancer. For the upper boundary (best case survival), we used SEER 2006 data in the GBD 2010; whereas in the GBD 2013, we used SEER 2010 survival data for the upper boundary.³ For the lower boundary (worst case survival), we used US Mortality Files from 1950 in the GBD 2010; whereas in the GBD 2013 we compared survival from the 1950 US Mortality Files to SurvCan data and used whichever survival was the lowest.⁴ We based our rationale for changing the lower boundary in the GBD 2013 on the premise that survival in the US in 1950 is unlikely to reflect the global worst case survival.

In contrast to the GBD 2010, we included mesothelioma in our estimations for GBD 2013. For the lower boundary, we used SEER 1975 survival data, as the US Mortality Files from 1950 do not include mesothelioma. For the upper boundary we used SEER 2010 data.

Survival for non-melanoma skin cancer (NMSC) is usually not reported in cancer registries. In the GBD 2010 we used melanoma survival data as a substitution for NMSC survival. In the GBD 2013, since NMSC is a much less aggressive disease compared to melanoma, we decided to use a survival of 100% as best case scenario.

The SEER publication used to generate survival curves in the GBD 2013 did not report yearly survival patterns for gallbladder cancer. Therefore, we used SEER 1973 data as worst case survival and SEER 2010 data as best case survival in the GBD 2013 estimates.

C.2 Timeframe for estimation of cohort survival

In the GBD 2010 we estimated survival up to 5 years and assumed that everyone who did not die of cancer within 5 years was a survivor. In the GBD 2013, we extended the timeframe for survival to 10 years since relative survival for most cancers continues to decline after 5 years and truncation of the survival curves at 5 years leads to an underestimation of disability due to disseminated and terminal cancer.

C.3 Duration of sequelae

To calculate YLDs for different cancers, we estimated the duration of time that the cancer population spends in four different sequelae: 1) diagnosis and treatment; 2) remission; 3) disseminated; 4) terminal. In the GBD 2010, only the population who dies within 5 years experiences all four sequelae. In the GBD 2013, we increased this number to the population who dies within 10 years. In the GBD 2010 the population that survived 5 years only experienced sequela 1; however, in the GBD 2013 we estimated duration of sequelae 1 and 2 for the 'survivor' group and only applied a disability weight to the remission for the first 5 years.

In the GBD 2010, we based duration of sequelae on expert opinion. In the GBD 2013, we estimated duration of sequela 1 (diagnosis and treatment) based on Neal et al. for esophageal, stomach, larynx, cervical, uterine, oral cavity, pancreas, testicular, kidney, bladder, nasopharyngeal cancer, cancer of other part of the pharynx, multiple myeloma, and leukemia.⁵ Since the duration described in this analysis did not include duration of treatment we added 2 months to account for the average treatment time. For lung, breast, prostate, colorectal, ovarian cancer, Hodgkin, and Non-Hodgkin lymphoma we used the durations described in Allgar et al. and added 2 months to account for the average treatment duration.⁶ For melanoma we used the duration until diagnosis described in Neal et al. and also added 2 months to account for treatment.⁷ For NMSC we used the duration of sequela 1 for melanoma.⁸ For liver, gallbladder, brain, thyroid cancer, and mesothelioma we based duration of sequela 1 on expert opinion.⁹

In the GBD 2013, we based duration of sequela 2 (remission) on the time until death or 5 years for the survivors minus the duration of the other sequelae.

In the GBD 2013, we based duration of sequela 3 (disseminated phase) on SEER analysis of median survival for patients with stage IV disease for melanoma, mesothelioma, esophageal, stomach, liver, lung, breast, cervical,

uterine, prostate, colorectal, gallbladder, ovarian, kidney, bladder, and pancreas cancer. For thyroid, larynx, oral cavity, nasopharyngeal cancer, and cancer of other part of the pharynx we used the SEER median survival of patients with stage IVc. For testicular cancer, we used the SEER median survival of patients with stage III. For NMSC, we based the duration of sequela 3 on Nolen et al. For Hodgkin and Non-Hodgkin lymphoma we based the duration of disseminated phase on Kewalramani et al. For multiple myeloma, leukemia, and other cancers we used SEER median overall survival of all patients regardless of stage.

C.4 Procedure sequelae

In the GBD 2010 we estimated disability due to procedure sequelae (mastectomy, laryngectomy, stoma for colorectal cancer, incontinence and impotence for prostate cancer, and incontinence for bladder cancer) only for the survivor population. Since these procedures do not ensure cure and lead to additional disability even in cancer patients who ultimately die of their disease, in the GBD 2013 we decided to estimate disability due to procedures for the whole cancer population.

Appendix D: Injuries

D.1 Overview of the calculation of YLDs due to injuries

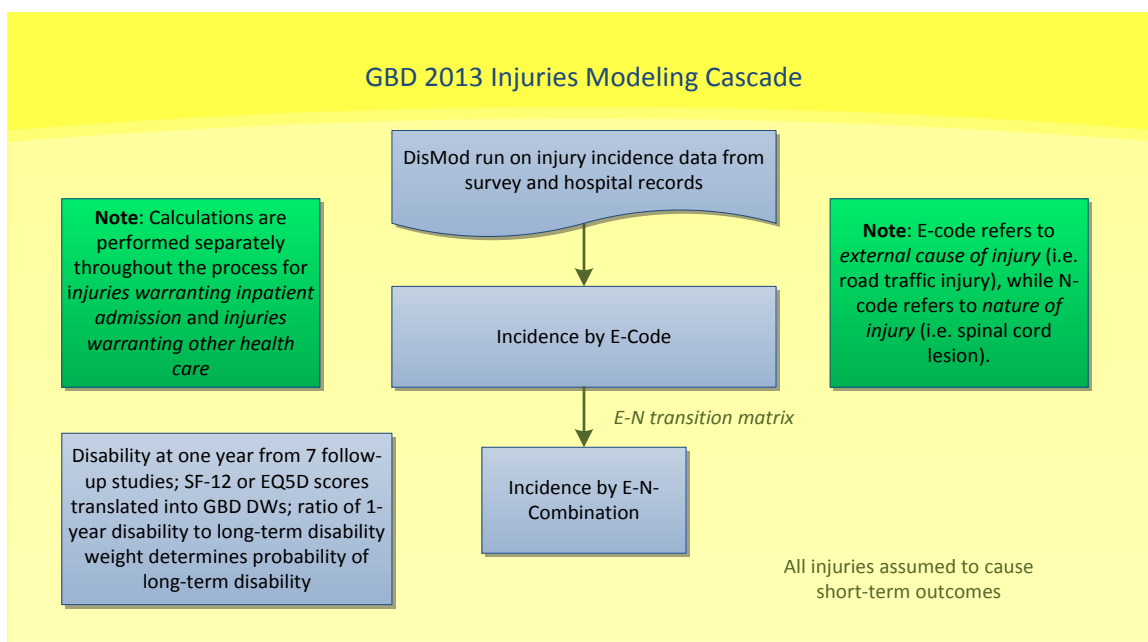

For the GBD 2013 study, we estimate the burden due to 26 external cause-of-injury categories and 47 nature-of-injury categories, for both short-term outcomes and lasting disability. Permuting each of these groups results in over 2400 unique sequelae; we wish to provide you with an overview of the process through which we derive morbidity estimates for each of these sequelae. What follows is a brief description of the various steps involved in this process, a list of the most significant departures from the GBD 2010 data and methodology, and finally a more detailed description of several of the more complex steps.

To estimate the morbidity from injuries, we use data from hospital and emergency department records and surveys to produce years lost to disability (YLDs) by country, year, sex, age, external cause-of-injury (E-code), and nature-of-injury (N-code). There are several interdependent steps in the process (see flowchart below):

- 1) We calculate a nature-of-injuries severity hierarchy used to assign a particular N-code to a patient that may have been coded with numerous N-codes. See additional documentation for more description of the reasoning and methodology behind this hierarchy.
- 2) We calculate incidence of “injuries warranting inpatient admission” and “injuries warranting other health care” by E-code. Multiple hospital, emergency department and survey datasets feed into these incidence models.
- 3) Because injury disability is linked to nature-of-injury (N-code) rather than cause-of-injury, we generate transition matrices to map the proportion of each E-code that results in a particular N-code. These matrices are based on a collection of dual-coded (e.g. both E- and N-codes) patient-level or aggregated hospital and emergency department datasets. We develop separate matrices for inpatient and outpatient injuries.
- 4) Next, we separate the concepts of short-term and long-term injury outcomes. We assume that all who suffer from an injury experience short-term outcomes (pain, motor impairment, etc.) but that a percentage of these people experience lasting disability from their injury. Furthermore, we assume that this percentage varies by nature-of-injury and whether the injury was treated or not. We develop empirical estimates of the probability of experiencing long-term outcomes for treated injuries based on the results of a combined analysis of unit record data from follow-up studies that have assessed an injured person’s health status for a year using SF-12 or EQ5D as generic health status instruments. Additionally, due to the lack of data regarding long-term outcomes of untreated injuries, we use expert opinion-driven estimates of the probability of developing long-term outcomes for untreated injuries relative to treated injuries. Using an IHME-developed proxy covariate, *Health System Access*, we assign a weighted average of the treated and untreated probabilities to each country-year to come up with country-year-N-code-specific estimates of the probability of developing long-term outcomes
- 5) We assume that long-term outcomes are lasting (i.e. no remission), but for short-term outcomes, we must come up with estimates for duration. This calculation is performed using patient responses to the Dutch Injury Surveillance System follow-up study, the details of which are in the additional documentation below. We supplement the empirically derived estimate of the duration treated injuries for each N-code with expert-opinion estimates of the duration for untreated injuries. For each country and year we take a weighted average of these treated and untreated duration using a linear interpolation on the scale of the health system access covariate. This process is identical to that performed in the calculation of the probability of long-term outcomes above. The incidence of short-term injury outcomes by unique E-code/N-code combination is multiplied by the N-code-specific duration to arrive at prevalence. Prevalence is then multiplied by the corresponding disability weights for short-term injury outcomes to estimate YLDs. Because of the computational strain we would incur with the addition of >1200 short-term injury sequelae, these outcomes are not included in our all-cause comorbidity correction micro-simulation tool. As their prevalence is small (due to the short duration) it would have little bearing on comorbidity in any case.

- 6) In the case of long-term outcomes, we must determine the probability that a patient will develop long-term disability following an injury of a given N-code. To do this we rely on the same datasets used to develop our injury hierarchy – a collection of follow-up studies with measurements of health status >1 year post-injury. The details of this calculation are included in the additional documentation below. These probabilities are then multiplied by the short-term incidence to get incidence of “injuries developing long-term outcomes” for each unique E-code/N-code combination.
- 7) In order to calculate YLDs, we must first arrive at prevalence. We utilize the DisMod modelling software developed at IHME to estimate prevalence given our incidence inputs, an assumption of zero remission (i.e. disability at one-year past-injury reflects lifetime disability) and, where applicable data on the excess risk of mortality associated with each N-code category. We found evidence for an increased risk of dying for long-term disability associated with spinal cord injury, burns, moderate to severe traumatic brain injury and hip fracture. Where we had multiple studies with SMR or RR data we used inverse variance meta-analysis to pool the data. We assumed the highest value SMR to apply to long-term disability from N-code “multiple significant injuries,” as we had no literature for this category and it tended to incorporate many severe injuries. For all other types of long-term disability we assume no excess mortality. Once the prevalence has been calculated, it is used as input for COMO, our comorbidity-correction microsimulation, which gives us final estimates of YLDs.

Appendix Figure D.1. Injuries Modeling Cascade

D.2 Significant differences from the GBD 2010

- We have incorporated additional data. In addition to receiving new inpatient and outpatient datasets from a variety of countries, we have incorporated new follow-up studies from the Netherlands and China and recent years of the Medical Expenditures Panel Survey from the U.S. A list of the new studies can be seen in attached spreadsheets. Please let us know if you are aware of additional available data that may be of use in our analysis.

- We use a more detailed list of nature-of-injury codes used, outlining 47 categories instead of the 23 used in the GBD 2010
- We report short-term outcomes by unique E-code/N-code category, rather than only by E-code
- We use a hierarchy to estimate the most severe N-code for patients with multiple natures-of-injury. We chose to do this as our GBD 2010 regression methods assigned a large number of cases of long-term disability to seemingly less severe N-code categories. With the hierarchy we aim to better assign the long-term disability to more severe injuries. Please see the documentation below for additional information on reasoning and methodology for this process.
- We allow for differing durations of short-term outcomes and probabilities of long-term disability depending on whether an injury was treated or not.

D.3 Detailed descriptions of specific steps in the calculation of YLDs from injuries

- A nature-of-injury hierarchy
- The duration of short-term outcomes of various nature of injury categories (N-codes) when untreated; and
- The probability of developing long-term outcomes of various nature of injury categories when left untreated.

These three aspects of the process will be explained in detail below. Due to the limited availability of data to inform these numbers, there have been varying degrees of expert-driven estimation for each aspect.

Nature-of-injury hierarchy

We decided to account for the co-occurrence of multiple natures of injury by assigning each injured individual in our hospital, survey, and literature-based datasets a single nature of injury that is estimated to account for the largest burden for that individual. In this way, we avoid overestimating the burden of minor injuries that frequently appear together with more severe injuries. In the GBD 2010, we used a regression-based approach with dummies for each nature of injury category and found an undue proportion of burden being assigned to seemingly less severe nature of injury categories. A hierarchy has been used in the previous GBD and some national burden studies but was fully expert-driven. We have sought a more empirically driven approach to setting a hierarchy for the GBD 2013.

The hierarchy aims to establish a one-to-one relationship between individual and nature of injury by selecting the nature of injury responsible for the largest burden when an individual experiences multiple injuries. Because the burden from long-term outcomes dwarfs that of short-term outcomes (due to the much longer duration), we sought to construct our hierarchy based on the mean long-term disability experienced by individuals experiencing a particular nature of injury.

To form an empirical basis for this hierarchy, we have relied on an analysis of follow-up surveys that contain information on long-term health status following specific natures of injury. This follows similar methods as we have described in our GBD 2010 paper on non-fatal outcomes.² For the GBD 2013, we have been able to add three more Dutch datasets (a follow-up of the first study that was used in the GBD 2010 and two other datasets following up burns and multi-trauma patients). We also have added a follow-up study carried out in one of the sites of the Chinese Injury Surveillance System run by China CDC. Briefly, our process consisted of mapping the health status measurements used by these studies (SF-12, SF-36 and EQ5D) into disability weight (DW) space, then running a regression of logit-transformed DW on nature of injury sustained and several individual characteristics. These characteristics included interactions between age, sex, and whether a patient was injured at some point in the dataset. This last characteristic related to the U.S. Medical Expenditures Panel Survey. In this survey only, we had multiple observations for patients that may have been injury-free during one observation but sustained an injury prior to a subsequent observation. We found that at certain ages and sexes, the self-reported uninjured health status differed between those that would eventually get injured and those that were never injured. This interesting finding led us to include that final term in the interaction. We also included a random effect on country, believing that self-reported health status may depend on the country a patient is from. Finally, several nature of injury categories, including

amputations, were assumed to have 100% probability of developing long-term outcomes and thus were automatically ascribed the GBD DW corresponding to the long-term treated sequela for that nature of injury.

We ran the regression process separately for “injuries warranting inpatient care” and “injuries warranting outpatient care” and created two separate hierarchies. We also ran the regression on the pooled data. Nature of injury categories that resulted in no long-term disability according to the analysis (i.e. after accounting for other sources of health loss no health loss remained to attribute to the injury of interest), were ranked below those that resulted in a positive long-term disability. These categories were then ranked by their GBD short-term outcome disability weights. If we observed a higher long-term disability in the outpatient regression than we did in the inpatient regression, we considered this implausible and used the mean disability from the pooled regression for both hierarchies.

Certain nature of injury categories were rare in our data set with mean values estimated from small sample sizes. In these cases especially, we feel expert opinion may be warranted to refine the position of specific nature of injury categories within the hierarchies.

Duration of short-term sequelae of untreated injuries

In the GBD 2010, the estimates of short-term duration were based on limited expert opinion. In the GBD 2013, we tried to find a more empirical basis for these estimates. In the Dutch Injury Surveillance System follow-up studies of 2007-2008 and 2001-2002, injured patients were asked at 2.5, 5 and 9 or 12 months post-injury whether they were still experiencing problems due to their injury.^{10,11} If not, they were asked how many days of problems they had experienced. To estimate the average duration of ‘experiencing problems’ after each nature of injury we took the average number of days reported by those who during the follow-up periods reported that they no longer had problems from the injury. Those who still reported having problems at one year we assumed to be captured as long-term disability cases by our separate analyses. The short-term duration estimates were estimated for those hospitalised for their injury and for outpatients, separately. The results of the Dutch study analyses are supplemented by expert-driven estimates of short-term duration for nature of injury categories that did not appear in the Dutch dataset. Our expert-driven estimates of the expected duration of short-term outcomes from “untreated” injuries are expressed as a multiplier of the “treated” duration estimates.

Probability of long-term disability from injuries

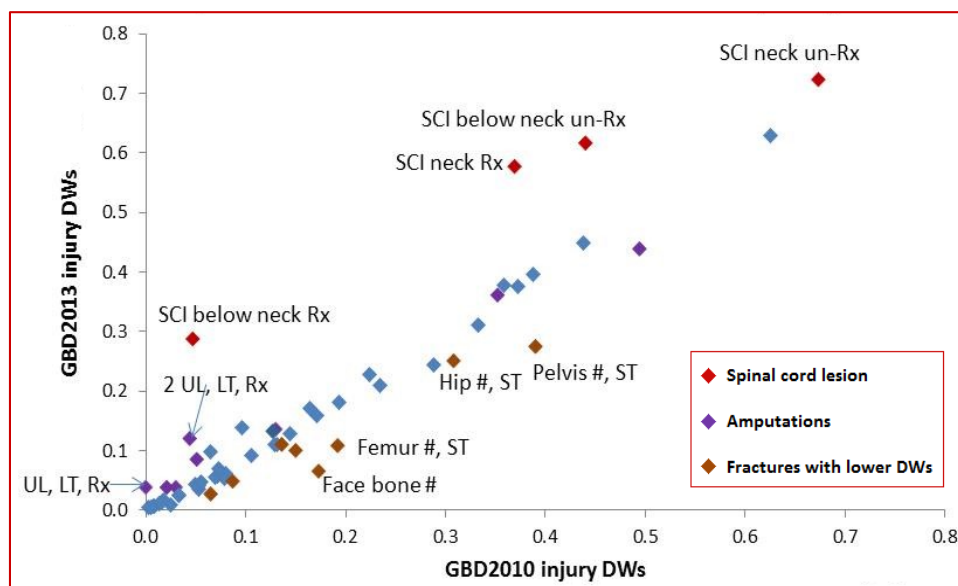

We generally follow the same strategy of determining the proportion of long-term disabling outcomes as in the GBD 2010 with a few differences:

- 1) We use an expanded list of nature of injury categories.
- 2) We use a hierarchy of nature of injury categories (see above).
- 3) We utilize an expanded dataset of injury follow-up studies as described above.
- 4) We allow for a difference in probability of long-term outcomes from treated and untreated injuries

The probability of treated long-term outcomes is estimated via the ratio of the average level of disability one year after an injury relative to the long-term disability weight for each nature of injury category. This is the same strategy used to calculate probability of long-term outcomes in the GBD 2010. Because this ratio incorporates the disability weights assigned to each N-code, the probabilities at which we arrive depend strongly on the choice of these disability weights. We have incorporated a new round of disability weights for the GBD 2013 study based on further data collection in 4 European countries, Hungary, Italy, Sweden and the Netherlands. The European DW study was initiated by ECDC (Europe’s equivalent of CDC).¹² IHME contributed additional funds to expand the sample size to a total of 30,000 respondents. The same method of pair-wise comparisons as in the GBD 2010 study was used. A large proportion of the GBD health states with their lay descriptions were repeated in the European surveys. We also added new health states for conditions that had not yet been covered (of interest for injuries: inclusion of a health state for concussion) and added re-written lay descriptions for the GBD 2010 health states that were found lacking in consistency or in content (of interest for injuries: we added incontinence in the description of the health states for spinal cord injury and made the descriptions of several amputation descriptions more consistent). We have decided to analyze the GBD 2010 and European surveys in a combined dataset. That means all DWs in the GBD 2013 are

different. Most are only different marginally, but some have changed quite a bit. For instance, the inclusion of incontinence in spinal cord injury led to higher DWs. Without change in the lay descriptions many of the fracture DWs got lower values in the European surveys and hence the GBD 2013 DWs are also lower. Appendix Figure D2 shows a scatterplot of the old vs. the new DWs marking those health states for which we have found the greater changes.

Appendix Figure D.2: Comparison of disability weights for GBD 2010 and GBD 2013

ST – short-term; LT – long-term; Rx – treated; un-Rx – untreated; UL – upper limb

In the GBD 2010 it was assumed that the probabilities of long-term outcomes derived from follow-up of treated injury patients equally applied to untreated cases. In the GBD 2013, we’ve made separate estimates for nature of injury categories where we expect a significantly higher probability of long-term disability in untreated cases. The difficulty with this approach is that, as one would expect, there are no follow-up data available for untreated patients. In the attached spreadsheet, the columns in blue show a first pass of expert-driven estimates of the ratio of the probability of long-term outcomes among treated persons to the probability of long-term outcomes among untreated persons.

For two long-term probabilities we had to employ different estimation methods. First, there were only 20 cases of “adverse effects of medical treatment” in our follow-up dataset, and all reported extremely high disability weights. This gave us 100% probability of permanent health-loss from this “cause-of-injury, which is problematic given that our initial incidence data for this cause-of-injury category is quite high, thus making YLDs attributed to this cause implausibly large. We decided that we have inadequate data to estimate the probability of permanent health-loss. Second, our long-term probability estimates for spinal cord lesions were implausibly low due to a much higher GBD 2013 disability weight than that used in the GBD 2010. Instead, we used a large USA study of spinal injuries followed for more than 1 year with data classified by the 5 category ASIA Impairment Scale (AIS A-E) of the American Spinal Injury Association (ASIA) International Classification of Spinal Cord Injury.¹³ We matched the descriptions of AIS A-E with appropriate GBD health states as follows: attributing a different proportion, disability weight and long-term probability to each according to a large study of spinal injuries (Appendix Table D1). Given we have two spinal lesion categories (at and below neck level), we used the same A-E proportions to split both.

Despite applying the N-code hierarchy to our follow-up dataset, we still observed implausibly high estimates of long-term disability for several outpatient N-codes. We made the decision to not allow any long-term disability from outpatient injuries in the following categories: open wound, poisoning, and contusion.

Appendix Table D.3. – ASIA impairment scale for spinal cord injury with matched health states, disability weights, and proportions at the one-year follow up mark

AIS Category	AIS Description of Impairment	Matched GBD Health State	Long-term		Proportion Attributed
			Disability Weight - Treated	Disability Weight - Untreated	
A	Complete – No motor or sensory function is preserved in the sacral segments S4-S5.	Spinal cord lesion at neck level (GBD 2013)	0.589	0.732	0.50
		Spinal cord lesion below neck level (GBD 2013)	0.296	0.623	0.50
B	Incomplete – Sensory but not motor function is preserved below the neurologic level and includes the sacral segments S4-S5.	Spinal cord lesion at neck level (GBD 2010)	0.463	0.682	0.07
		Spinal cord lesion below neck level (GBD 2010)	0.057	0.46	0.07
C	Incomplete – Motor function is preserved below the neurologic level, and more than half of key muscles below the neurologic levels have a muscle grade less than 3.	Spinal cord lesion at neck level (GBD 2010)	0.463	0.682	0.14
		Spinal cord lesion below neck level (GBD 2010)	0.057	0.460	0.14
D	Incomplete – Motor function is preserved below the neurologic level, and at least half of key muscles below the neurologic level have a muscle grade of 3 or more.	Motor impairment, moderate	0.061	0.610	0.27
		Motor impairment, moderate	0.061	0.610	0.27
E	Normal – Motor sensory function is normal.	No long-term disability	-	-	0.01

Appendix E: Impairments

E.1 Anemia

To estimate anemia in the GBD 2013, we employed largely the same method as we did in the GBD 2010. Despite broad similarity in methods, several key changes affected magnitude and age patterns of anemia burden, as well as magnitude and severity-distribution of aetiology-specific estimates. Our GBD 2013 strategy began with the calculation of an anemia envelope – a determination of mean hemoglobin as well as sum total of anemia prevalence by severity for each country, age group, and both sexes for each year from 1980 through 2010. The envelope approach avoided double counting while capturing potentially different disease profiles within each population group. We defined a population group as a specific country, sex, age-group, and year.

Our dataset for estimating the anemia envelope contained more than four times as many data points as it did in the GBD 2010 (9899 versus 2425), and notably included data from Turkey and India as well as subnational data from the United Kingdom, China, and Mexico.¹⁴ We predicted mean hemoglobin levels for all missing population groups using a mixed-effects regression with fixed effects on prevalence of severe underweight (<2SD below mean; same as the GBD 2010) and age group and nested random effects on super-region, region, and country/subnational site. We again separated each population into five groups: male and female children under 5 years, pregnant females, non-pregnant females, and males over 5 years. The net effect of this new data was most pronounced in populations under age 10, where predicted mean hemoglobin levels in this analysis were consistently higher (and anemia prevalence therefore lower) than were predicted in the GBD 2010. Second, in recognizing the limitations of predicting anemia prevalence—especially severe anemia—directly from mean hemoglobin using multiple steps, we instead pooled survey microdata for each population group separately and fitted the pooled data with Weibull distributions. We then performed OLS regression of the shape and scale parameters versus all predicted mean hemoglobins predicted above. The net effect of this change was quantitatively minimal, but greatly improved the efficiency of envelope calculation.

Appendix Table E.1 - Severity definitions and corresponding disability weights used to calculate GBD 2010 anemia envelope			
	Severity of anemia		
	Mild	Moderate	Severe
Age < 5 years			
Males	110 - 119 g/L	80 - 109 g/L	50 - 79 g/L
Females	110 - 119 g/L	80 - 109 g/L	50 - 79 g/L
Age 5+ years			
Males	120 - 129 g/L	90 - 119 g/L	60 - 89 g/L
Females, non-pregnant	110 - 119 g/L	80 - 109 g/L	50 - 79 g/L
Females, pregnant	100 - 109 g/L	70 - 99 g/L	40 - 69 g/L

We adopted different thresholds for defining anemia by age than were used in the GBD 2010 as they do not reflect the hematologic realities of early life. The GBD 2010 and the GBD 2013 thresholds are in Appendix Tables C1 and C2. Since the GBD 2000, likely in recognition of this same phenomenon, WHO recommendations have changed. Our current thresholds match those published by WHO with the exception of those under 1 month of age, where there is no internationally recommended cutoff for diagnosing anemia. The net effect of these changes was substantial, as expected. In the GBD 2013, anemia estimates were greatly reduced amongst 1-9 year olds, though they still remained the age groups most afflicted by anemia, and estimates were higher than the GBD 2010 amongst those less than 1 year of age. We estimated anemia to be nearly zero in the GBD 2010 for most population groups under 1 year old.

Appendix Table E.2 - Severity definitions and corresponding disability weights used to calculate GBD 2013 anemia envelope

	Severity of anemia		
	Mild	Moderate	Severe
Age < 1 month			
Males	130 - 149 g/L	90 - 129 g/L	< 90 g/L
Females	130 - 149 g/L	90 - 129 g/L	< 90 g/L
Age 1 month - 5 years			
Males	100 - 109 g/L	70 - 99 g/L	< 70 g/L
Females	100 - 109 g/L	70 - 99 g/L	< 70 g/L
Age 5 - 14 years			
Males	110 - 114 g/L	70 - 99 g/L	< 70 g/L
Females	110 - 114 g/L	70 - 99 g/L	< 70 g/L
Age 5+ years			
Males	110 - 129 g/L	80 - 109 g/L	< 80 g/L
Females, non-pregnant	110 - 119 g/L	80 - 109 g/L	< 80 g/L
Females, pregnant	100 - 109 g/L	70 - 99 g/L	< 70 g/L

We performed cause-specific attribution on the anemia envelope using information on cause-specific prevalence and hemoglobin shift using the same method as in the GBD 2010. Total “hemoglobin shift” was determined as the difference between the normal and predicted mean hemoglobin levels for each population group. We denoted the normal hemoglobin level as the global 95th percentile of the distribution of mean-hemoglobin within each age-group, sex, and year. We then determined a total shift for each country in the corresponding age-group, sex, and year by finding the difference between the global “normal” and the country-specific predicted mean hemoglobin. Our model of attribution followed that, because the shift is a disease state experienced by 100% of the population, then the sum of cause-specific hemoglobin shifts times the prevalence of each contributing cause should add up to the total. We summed shift times prevalence estimates from all causes, compared to the total predicted hemoglobin shift, and proportionally assigned. We distributed the residual envelope among seven remaining causes. Of note, our iron-deficiency anemia (IDA) estimates include acute and chronic hemorrhagic states for which supplementation may be helpful, but poor nutritional intake is not the only underlying problem. A few causes in this category – hookworm, schistosomiasis, upper gastrointestinal bleeding, and gynecologic diseases – were considered separately from IDA because there was enough data from the GBD 2010 to do so. Distribution of anemia burden to IDA only after assignment to “known” causes avoided double counting of these cases. Most other causes of anemia not specifically considered were included in the “other” categories.

Two changes in the GBD 2013 analysis affected the aetiology-specific anemia estimates. First, and most importantly, we identified an inconsistency in this cause-specific attribution method where the total number of cases of anemia due to a condition was not bounded to be less than the total number of cases of the condition itself. We have introduced a method in this analysis to ensure that bounds are included. Second, inherent in our method of determining “normal” hemoglobin is the fact that 5% of population groups will have zero, or negative, total shift. In these cases, or when the sum of all causes’ shift-times-prevalence estimates exceeded the total shift, we assigned the denominator to be equal to the sum of the numerators. Subsequent review of findings from National Health and Nutrition Examination Survey (NHANES) suggested that the implicit assumption of zero residual—and therefore zero IDA—in the GBD 2010 approach was implausible.^{15,16} Based on the published rates of IDA seen in these analyses, we therefore introduced a minimum of 10% of all anemia to be assigned to residual causes in the GBD 2013.

In order to disaggregate marginal estimates of anemia severity and aetiology into a complete set of prevalence estimates for aetiology/severity pairs, we developed a new method for the GBD 2013 that employed techniques from Bayesian contingency table modelling.^{17,18} The model combined marginal estimates on the row sums (total aetiology prevalence for each cause) and column sums (total anemia prevalence by severity [mild, moderate, severe]) with priors on the mean hemoglobin shift for each aetiology and priors on the rank order of variation of severity (i.e. anemia due to malaria is expected to vary most between cases of all aetiologies, whereas anemia due to sickle cell disorders are expected to be some of the least variable in severity). We used nonlinear optimization to find the maximum a posteriori (MAP) point estimate for 50 samples from estimated posterior distributions on the marginal values (aetiology and severity estimates) independently for each country/year/sex/age-group, and then scaled and shifted these estimates to ensure that updated marginal row sums were all non-zero and the updated column sums matched the original draws exactly.

E.2 Epilepsy

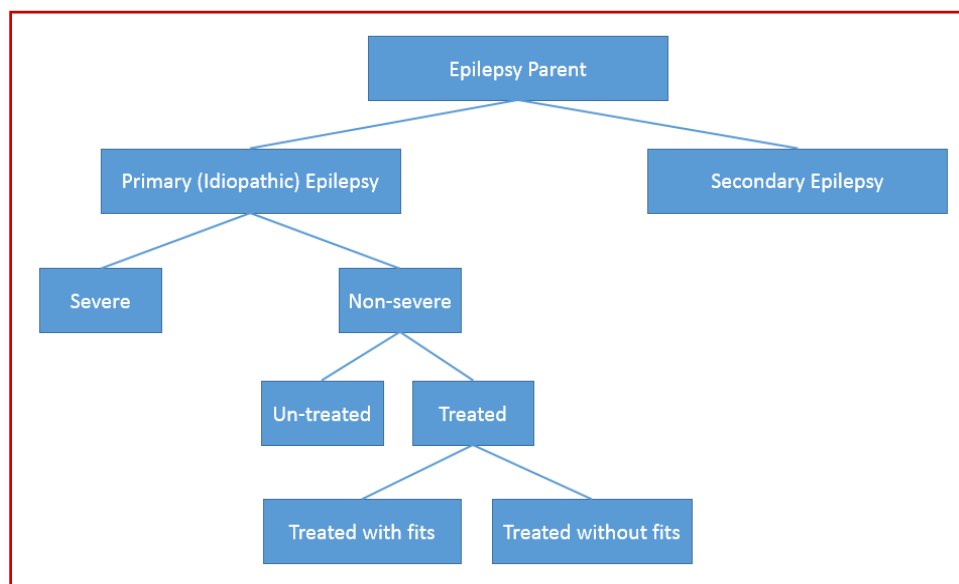

In the GBD 2013, we used the following definitions from the “Guidelines for Epidemiologic Studies on Epilepsy:”¹⁹

Epilepsy. A condition characterised by recurrent (two or more) epileptic seizures, unprovoked by any immediate identified cause.

“Active” epilepsy. A prevalent case of active epilepsy is defined as a person with epilepsy who has had at least one epileptic seizure in the previous 5 years, regardless of antiepileptic drug (AED) treatment.

We divided epilepsy parent (epilepsy impairment envelope) to primary (or idiopathic) and secondary epilepsies. Each of these were subdivided into “severe” (on average 1 or more fits per month) and “non-severe.” Non-severe cases were sub-divided into “treated” and “un-treated.” Finally, “treated” cases were divided into “treated cases with fits” (between 1 and 11 fits on average in preceding year) and “treated cases without fits” (no fits reported in preceding year) (Appendix Figure C1).

Appendix Figure E.1: Epilepsy classification for the GBD 2013

Epidemiological data sources: mortality and morbidity

We conducted a systematic review to update the GBD 2010 dataset. Inclusion criteria were:

- Representative, population-based surveys
- Reporting of prevalence, incidence, remission rate, excess mortality rate, relative risk of mortality, standardised mortality ratio or with-condition mortality rate.

We excluded the studies with no clearly defined sample, for example, among clinic attenders or patient organization members with not-specific or non-representative catchment area. The count of prevalence data points dropped from 1885 in GBD 2010 to 1464 in GBD 2013 as we dropped 712 lifetime prevalence data points and added 291 new data points.

Proportions of idiopathic (vs. secondary) and severe epilepsy

We used a mixed-effects generalised linear model (binomial family) to predict the proportion of idiopathic epilepsy. We used a fixed effect on LDI, a lagged transformation of GDP per capita and super-region random effects in the final model. We also tested health system access as well as region and country effects in different models, but they did not improve the model (Appendix Tables C3 and C4). We used a similar model to predict the proportion of severe epilepsy and treatment gap based on the reported proportions extracted from the systematic review. We used fixed effects on health system access and LDI and super-region random effects in the final model for severe epilepsy. We also tested region and country effects in different models, but they did not improve the model. For estimating the treatment gap, we used fixed effects on LDI and health system access and super-region random effects in the final model. We tested region and country effects in different models, but they did not improve the model. We generated 1,000 draws of country-specific estimates for each year between 1980 and 2013 for each of the models.

Appendix Table E.3. - Coefficients of mixed effect generalised linear model (binomial family) for proportions of idiopathic and severe epilepsy in the countries

Dependent	LDI	HSA	Super-region	Constant
	β	β	β	β
Idiopathic proportion	-0.000025 (-0.000033, -0.000018)	removed	0.7124 (0.2478, 2.0475)	0.3217 (-0.3094, 0.9528)
Severe, proportion	-0.000017 (-0.000025, -0.000008)	-0.1742 (-0.2446, -0.1038)	0.0645 (0.0165, 0.2514)	-0.1569 (-0.3718, 0.0581)
Treatment gap	-0.000044 (-0.000059, -0.000029)	-0.162 (-0.2057, -0.1183)	0.5801 (0.1934, 1.74)	0.7259 (0.1423, 1.3095)

Appendix Table E.4. - Random effect (with its standard error) of GBD super-regions for proportion of severe epilepsy and treatment gap

Super-regions	Idiopathic, proportion		Severe, proportion		Treatment gap	
	Random effect	SE for RE	Random effect	SE for RE	Random effect	SE for RE
Central/ Eastern Europe, and Central Asia	-0.2772	0.041	0.3276	0.0768	0.2361	0.2346
High-income	0.5839	0.0214	-0.023	0.0263	-1.4558	0.0896
Latin America and Caribbean	-0.3527	0.0527	0.1353	0.1083	0.0962	0.0698
North Africa and Middle East	1.1317	0.0567	-0.2332	0.1518	0.3063	0.1267
South Asia	0.4426	0.1176	-0.2748	0.1003	-0.5866	0.0492
Southeast Asia, East Asia, and Oceania	0.1783	0.0309	0.2902	0.0707	0.2832	0.1124
Sub-Saharan Africa	-1.7066	0.0289	-0.2221	0.0729	1.1206	0.0605

Seizure-free treated epilepsy

There were too few data points (only 7 studies) to use a mixed effects model. Instead, we used meta-analysis to generate two different pooled estimates for proportion of seizure free treated epilepsy in developing and developed countries (Appendix Figure E.2.)

Appendix Figure E.2: Pooled estimated for proportion of seizure-free treated epilepsy

Modelling Specifications

We used the DisMod-MR 2.0 tool for the epilepsy impairment envelope to model a consistent fit between incidence, prevalence, remission, and SMR data while using meta-regression to correct data points with non-reference study quality characteristics. We assumed a non-zero prevalence at birth to account for neonatal and congenital causes of epilepsy. We found no systematic bias for the covariate “non-standard case definition” indicating studies that did not define ‘active epilepsy’ and added this covariate as a ‘z-cov’ to the model which means a multiplier is applied to the standard error and thus is given less weight in the analysis than the ‘reference’ data points. We also tested ‘life-time prevalence’ and ‘sampling strategy’ as covariates. In the GBD 2013, we excluded data of life-time prevalence and did not use sampling strategy as a z-cov because it did not have a significant effect. We used the log of age-standardised death rates of epilepsy (from the cause of death model of epilepsy) as a country level covariate for prevalence (Appendix Table C5).

Appendix Table E.5. - The fixed effect values of covariates in epilepsy impairment envelope model

Parameter	Covariates	Type	Value	Exponentiated
Prevalence	Nonstandard case definition	Study-level (z-cov)	0.030 (0.009 — 0.062)	1.03 (1.01 — 1.06)
Incidence	Nonstandard case definition	Study-level (z-cov)	0.45 (0.062 — 1.81)	1.57 (1.06 — 6.10)
Prevalence	Epilepsy	lnASDR	0.008 (-0.008 — 0.026)	1.01 (0.99 — 1.03)

We split the epilepsy impairment envelope according to the proportions generated by the generalised linear models and meta-analysis. Of the results, we combined the non-severe untreated and non-severe treated with fits groups into the “Epilepsy, seizures 1-11 per year” category. We categorised the severe epilepsy category as “Epilepsy, seizures \geq once a month.” For treated epilepsy without recent seizures we decided to use a more generic health state for other conditions without symptoms requiring daily medication (e.g. uncomplicated diabetes).

Disease Severity

In the GBD 2010, we wrote the lay descriptions for epilepsy health states before the systematic reviews of epidemiological surveys. The information on seizure frequency in the lay descriptions of severe (‘seizures once a week’), untreated (seizures once every 2 weeks’), and ‘treated with seizures’ (‘seizures once a month’) epilepsy health states were consistent with the categorisation in epidemiological studies where severe is one seizure a month or more and as the untreated and treated with seizure categories refer to non-severe cases. We collected information on average seizure frequency from 35 studies and fit a curve through the heterogeneous data in order to infer the average DW in each severity category.

In the GBD 2013, a new opportunity to derive DWs was provided by a study in 4 European countries replicating the GBD 2010 methods of pair-wise comparisons.¹² We collaborated with the European researchers allowing us to field alternative formulations of our lay descriptions. Appendix Table C6 shows the health states, lay descriptions, and disability weight values from the GBD 2010 and the GBD 2013 studies. The average DW per prevalent case of epilepsy globally has risen from 0.31 to 0.34.

Appendix Table E.6. - Comparison of disability weights for epilepsy in the GBD 2010 and the GBD 2013				
GBD 2010 health states	GBD 2010 lay descriptions	GBD 2010 DW		
		Mean	Lower limit	Upper limit
Epilepsy, treated, seizure free	had sudden seizures in the past, but they have stopped now with medicines. The person has some drowsiness, difficulty concentrating, and some anxiety about future episodes.	0.072	0.047	0.106
Epilepsy, treated, with recent seizures	has sudden seizures once a month, with violent muscle contractions and stiffness and loss of consciousness. Between seizures the person has some drowsiness, difficulty concentrating, and anxiety about future episodes.	0.319	0.211	0.445
Epilepsy, untreated	has sudden seizures twice a month, with violent muscle contractions and stiffness, loss of consciousness, and loss of urine or stool control. Between seizures the person has anxiety about future episodes.	0.42	0.279	0.572
Epilepsy, severe	has sudden, prolonged seizures once a week, with violent muscle contractions and stiffness, loss of consciousness, and loss of urine or stool control. Between seizures the person has drowsiness, memory loss, difficulty concentrating, and anxiety	0.657	0.464	0.827
GBD 2013 health states	GBD 2013 lay descriptions	GBD 2013 DW		
		Mean	Lower limit	Upper limit
Epilepsy, seizures \geq once a month	has sudden seizures one or more times each month, with violent muscle contractions and stiffness, loss of consciousness, and loss of urine or bowel control. Between seizures the person has memory loss and difficulty concentrating.	0.552	0.375	0.71
Epilepsy, seizures 1-11 per year	has sudden seizures two to five times a year, with violent muscle contractions and stiffness, loss of consciousness, and loss of urine or bowel control.	0.263	0.173	0.367
Generic uncomplicated disease: worry and daily medication	has a chronic disease that requires medication every day and causes some worry but minimal interference with daily activities.	0.049	0.031	0.072

Appendix Table E.7. shows that there are 42.4 million individuals suffering from primary and various causes of secondary epilepsy in 2013 up from 30.4 million in 1990 – over half of which are due to epilepsy without a clear underlying cause and presumed to be largely genetically determined.⁸⁸ Three neonatal causes (preterm birth, neonatal encephalopathy, and hemolytic disease of the newborn) account for a fifth of epilepsy cases but the evidence base for the long-term outcomes of neonatal disorders including epilepsy remains small. The remaining primary causes of epilepsy come from ten other infectious disease causes. Cases with severe epilepsy (seizures more than once a month) account for almost half (46.3%), 41.4% are untreated or despite treatment continue to experience at least one seizure per year and the remaining 12.3% is seizure-free on treatment. Prevalence and YLD by underlying cause for 1990 and 2013 and the prevalence by severity are shown in Appendix table E.7.

Appendix Table E.7. Prevalence and YLDs, with percent of total, for epilepsy by cause, 1990 and 2013, and prevalence by severity in 2013

	Total Prevalence (in thousands)		Total YLDs (in thousands)		Prevalence 2013 (in thousands)		
	1990	2013	1990	2013	Treated, seizure-free	Less severe	Severe
Primary epilepsy	16,512.8 (54.37%)	21,717.9 (51.18%)	5,364.9 (67.52%)	7,544.2 (61.43%)	2,506.0 (5.91%)	8,955.2 (21.10%)	10,256.5 (24.07%)
Unassigned secondary epilepsy	7,992.0 (26.31%)	10,863.9 (25.60%)	-	-	1,508.0 (3.55%)	4,579.3 (10.79%)	4,776.4 (11.25%)
Preterm birth complications	1,693.9 (5.58%)	4,506.3 (10.62%)	836.3 (10.53%)	2,246.4 (18.29%)	519.9 (1.23%)	1,786.4 (4.21%)	2,200.1 (5.42%)
Neonatal encephalopathy due to birth asphyxia and trauma	1,324.1 (4.36%)	2,046.6 (4.82%)	697.0 (8.77%)	1,095.6 (8.92%)	248.7 (0.59%)	847.9 (2.00%)	999.9 (2.38%)
Hemolytic disease and other neonatal jaundice	876.3 (2.88%)	1,573.2 (3.71%)	463.0 (5.83%)	842.7 (6.86%)	195.5 (0.46%)	656.6 (1.55%)	790.6 (1.90%)
Cysticercosis	1,390.2 (4.58%)	1,031.2 (2.43%)	391.3 (4.93%)	310.4 (2.53%)	146.1 (0.34%)	446.9 (1.05%)	438.2 (1.07%)
Pneumococcal meningitis	136.7 (0.45%)	187.3 (0.44%)	39.9 (0.50%)	59.1 (0.48%)	25.4 (0.06%)	83.2 (0.20%)	70.1 (0.17%)
H influenzae type B meningitis	89.5 (0.29%)	112.0 (0.26%)	26.6 (0.33%)	35.6 (0.29%)	15.7 (0.04%)	50.6 (0.12%)	46.3 (0.11%)
Food-borne trematodiasis	112.1 (0.37%)	108.1 (0.25%)	32.7 (0.41%)	33.9 (0.28%)	14.7 (0.03%)	44.7 (0.11%)	46.3 (0.11%)
Other meningitis	70.2 (0.23%)	86.2 (0.20%)	21.5 (0.27%)	28.2 (0.23%)	11.5 (0.03%)	38.1 (0.09%)	36.6 (0.09%)
Encephalitis	67.5 (0.22%)	83.9 (0.20%)	21.0 (0.26%)	28.4 (0.23%)	10.5 (0.02%)	35.2 (0.08%)	33.2 (0.08%)
Malaria	52.2 (0.17%)	75.9 (0.18%)	27.5 (0.35%)	40.8 (0.33%)	11.9 (0.03%)	35.3 (0.08%)	23.0 (0.06%)
Meningococcal meningitis	20.1 (0.07%)	29.2 (0.07%)	6.0 (0.08%)	9.2 (0.08%)	4.4 (0.01%)	13.3 (0.03%)	11.5 (0.03%)
Tetanus	27.8 (0.09%)	7.4 (0.02%)	15.0 (0.19%)	4.2 (0.03%)	0.8 (0.00%)	3.1 (0.01%)	3.3 (0.01%)
Cystic echinococcosis	8.3 (0.03%)	6.8 (0.02%)	2.6 (0.03%)	2.3 (0.02%)	0.9 (0.00%)	2.8 (0.01%)	3.2 (0.01%)
Total Prevalence	30,373.6 (100.00%)	42,436.0 (100.00%)	-	-	5,220.0 (12.30%)	17,578.5 (41.42%)	19,637.5 (46.28%)
Total YLDs	-	-	7,945.3 (100.00%)	12,280.8 (100.00%)	200.0 (1.63%)	3,616.4 (29.45%)	8,464.4 (68.92%)

E.3 Hearing impairment

We modelled the prevalence of hearing loss over five steps. First, we ran three DisMod-MR 2.0 models to estimate the total prevalence estimates of hearing loss: normal hearing (0- 19dB), mild hearing loss (20-34dB), and moderate hearing loss and above (35+ dB). We squeezed the prevalence estimates from these DisMod-MR 2.0 models to fit within the entire population of each country. We estimated prevalence of normal hearing for this squeezing purpose only, and hence did not form part of further analysis. Appendix Figure C3 provides an example of the DisMod-MR 2.0 model showing the data points in gray and prevalence estimates at regional level in purple.

Second, we ran five additional DisMod-MR 2.0 models for each severity levels of hearing loss above mild: moderate (35-49dB), moderately severe (50-64dB), severe (65-79dB), profound (80-94dB), and complete (95+). We then squeezed the prevalence estimates from these models to fit within the prevalence that were estimated for 35+dB in the first step. By the end of the second step, we had estimated prevalence of six severity levels of hearing loss, including mild (20-34dB).

Third, we adjusted the prevalence of each severity level by accounting for hearing aids. We assumed the use of hearing aids reduced the severity by one level. Data obtained from a survey in Norway provided detailed information on people with hearing aids, which was used to estimate the proportion of hearing aids for each severity level.²⁰ We ran a log-linear regression with binary indicator for severity levels. We used the estimated coefficients to transform the prevalence of each severity level and proportionally squeeze to determine the proportion of hearing aids in each severity level. We shifted the identified fraction of people in each severity level a level below, except for complete hearing loss, which we assumed was not correctable by hearing aids. This provided the adjusted prevalence of six severity levels of all-cause hearing loss.

Fourth, we estimated the prevalence of hearing loss due to multiple causes: otitis media, congenital, meningitis (pneumococcal, H influenza type B meningitis, meningococcal, and other bacterial), and age-related and other causes not classified elsewhere. For congenital hearing loss, we assumed that all hearing losses occurring at the time of birth are of congenital nature. We implemented proportional squeezes to scale cause-specific hearing loss prevalence to the total prevalence of each severity level.

Finally, we estimated the percent of people experiencing tinnitus for at least 5 minutes per day by severity level using data from the US National Health and Examination Survey (NHANES) from 1999-2004 and two datasets from the United Kingdom. We calculated confidence intervals assuming a binomial distribution. We assumed the same distribution of tinnitus across all types of hearing loss.

Appendix Figure E.3: Prevalence of 35+ dB in Andean Latin America for males in 2013

E.4 Heart failure

We modeled a heart failure envelope and estimated aetiologic fractions to generate prevalence and burden of heart failure due to each GBD cause. We estimated the aetiologic fractions using data from a literature review, causes of death data, results of modelling causes of death data, and hospital discharge data. We attributed each heart failure case to one of the 20 conditions that might lead to heart failure: ischemic heart disease; cardiomyopathy and myocarditis; hypertensive heart disease; Chagas; chronic obstructive pulmonary disease; other interstitial lung disease; rheumatic heart disease; other circulatory diseases (non-rheumatic cardiac valve disease and pericarditis); endocarditis; thalassemia; iron deficiency anemia; iodine deficiency; G6PD deficiency; other endocrine, nutritional, blood, and immune disorders; other hemolytic anemia; congenital heart anomalies; coal worker's pneumoconiosis, asbestosis; silicosis; and other pneumoconiosis.

We calculated the estimates for heart failure attributable to the 20 causes in a three-step process. First, we grouped the 20 causes into seven more general major cause groups, including: ischemic heart disease; cardiomyopathy and myocarditis; hypertensive heart disease; Chagas; cardiopulmonary; valvular heart disease; and other causes. For these major cause groups, we conducted a systematic review of the literature and extracted individual hospital discharge data. We also analysed cause of death data and assessed distribution of the heart failure death and each major cause group death. As a conceptual basis for this analysis, if we observed an increase in deaths coded as heart failure and a concurrent decrease in deaths coded to one of the seven major cause groupings (adjusted by the total number of deaths from these seven causes), we concluded that the death was misclassified as heart failure, a garbage code, and used this to inform our allocation of heart failure to that cause. For this analysis, we used available data in ten years in either direction, created ten-year age groups, and incorporated nested region and super-region random effects in order to better-inform our estimates for redistribution, especially in low-data areas.

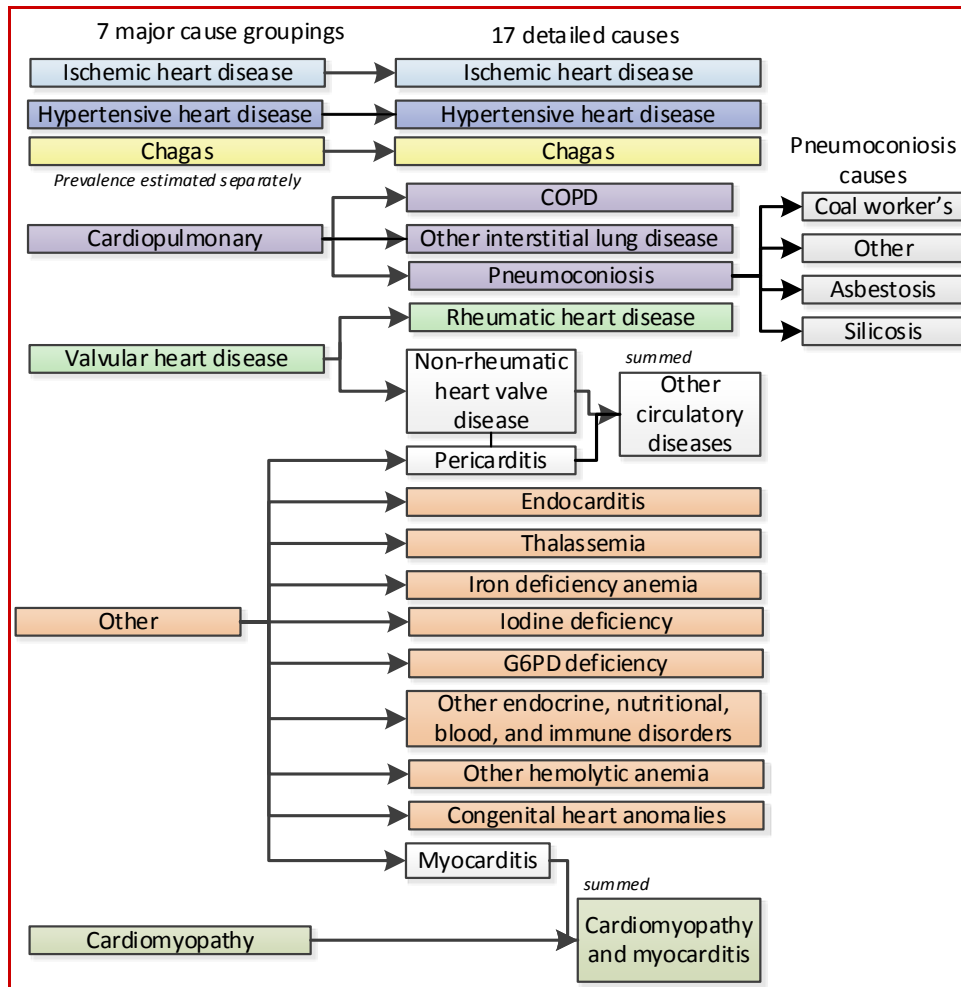

We used the DisMod-MR 2.0 Bayesian meta-regression tool to model the cause fraction for each of the seven major cause groupings using the three data inputs mentioned above. We also used relevant country-level covariates to inform the level if the coefficient of the covariate was plausible. After modelling each major cause separately, we rescaled the results to add to one. The rescaling process was based on the assumption of one patient-one cause.

Second, we disaggregated the seven major cause groupings into the more detailed 17 causes of heart failure. The split was proportional to the number of deaths due to the component cause in each major cause. We split cardiopulmonary into chronic obstructive pulmonary disease (COPD), other interstitial lung disease, and pneumoconiosis; we split valvular heart disease into rheumatic heart disease and non-rheumatic heart valve disease; and we split other into endocarditis, pericarditis, thalassemia, iron deficiency anemia, G6PD deficiency, other endocrine, nutritional, blood and immune disorders, other hemolytic anemia, and congenital heart anomalies. We summed pericarditis and non-rheumatic heart valve diseases fractions were summed to make "other circulatory diseases" aetiologic fraction.

Third, we split pneumoconiosis into coal worker's pneumoconiosis, asbestosis, silicosis, and other pneumoconiosis. This split is illustrated in Appendix Figure C4.

One difference between the GBD 2010 and the GBD 2013 is that we modeled heart failure due to Chagas separately. Data on the proportion of heart failure due to Chagas is very limited and the resulting estimates did not well match the known trends and the spatial distribution of Chagas; moreover, this approach produced implausible estimates among some groups (e.g. the estimated prevalence of heart failure due to Chagas among the elderly in Brazil exceeded the prevalence of Chagas among the same group). We revised our approach to address these concerns. Rather than estimating the proportion of heart failure due to Chagas, our new approach is to estimate the attributable risk of heart failure among those with Chagas. Using age-sex specific data from a Brazilian cohort study (unpublished data from Sabino et al. "Ten-Year Incidence of Chagas Cardiomyopathy Among Asymptomatic *Trypanosoma cruzi*-Seropositive Former Blood Donors." *Circulation*. 2013; 127: 1105-1115.),²¹ we estimated the Chagas attributable risk of heart as the prevalence of heart failure among those with Chagas, minus the prevalence of heart failure among those without Chagas. We then multiplied these age-sex specific estimates times our estimates of the prevalence of Chagas to determine the prevalence of heart failure due to Chagas.

Appendix Figure E.4.: Three-step process for estimating heart failure

We estimated the prevalence of the heart failure envelope in DisMod-MR 2.0 using incidence, prevalence, and case fatality of heart failure. We used mean body mass index as a country-level fixed effect covariate to inform estimation for the regions without data. We used hospital discharge rate in developed and developing countries and adjusted the level by age and developing/developed country source to be comparable with prevalence of heart failure.

Data

Step 1: Modelling the seven major cause groups

We used three types of data in the first step of estimating the aetiologic fraction for the 7 major causes.

1 – Modelling heart failure-specific death: The input database used for the analysis of causes of death data was comprised of 1,720 country-years of vital statistics, which were primarily gathered for use in the World Health Organization (WHO) Mortality Database.²² 1,113 country-years of these vital statistics were reported according to International Classification of Disease (ICD) 10 standards, and 607 country-years were reported according to ICD9 standards. Overall, the database encompassed 117 countries in 18 different GBD regions from 1980-2010.

2 – Extractions from individual hospital admissions: We analysed admissions from 29 countries in Europe, North America, and Central Latin America. Brazil's hospital data was outliered due to smaller observed prevalence of

heart failure compared to other hospital areas and other systematic data. The hospital admission data spanned from 1989 to 2012. We used all hospital admissions where the primary ICD code was for heart failure, and a secondary ICD code mapped to one of our 7 causes. We then estimated relative proportions of each of the 7 causes based off of this data.

3 – Literature review: In the GBD 2010, we conducted a systematic review to find the studies that reported patients with heart failure attributable to the seven major cause groupings. We updated this systematic review with studies after 2010 and incorporated additional papers that were suggested to us by expert groups. Overall, we used 57 studies in the analysis.

Step 2: Modelling the 17 individual causes

The three causes disaggregated in step two included cardio-pulmonary, valvular heart disease, and other. For the cardiopulmonary and other causes, we used Cause of Death estimates to estimate the proportions attributable to each cause. Because the Cause of Death estimates do not produce disease-specific results for the valvular heart disease causes, we used vital registration data and redistributed proportionally. For the vital registration data, we used ICD9 detailed and ICD10 detailed data and extracted the proportion of each detailed cause within the major cause grouping. We used five-year bounds for year in either direction and 10-year age groups.

Step 3: Splitting pneumoconiosis

Finally, we split the proportion of heart failure attributable to pneumoconiosis into four sub-causes: asbestosis; silicosis; coal worker’s lung; and other pneumoconiosis. We split them proportionally according to the total prevalence of the total causes.

Heart failure envelope

To model the total number of heart failure cases that were subsequently allocated to the 17 detailed causes, we conducted a systematic review of the literature and extracted data on prevalence, incidence, and case fatality of heart failure. By definition, a case of a heart failure was a patient diagnosed with a reduced systolic ejection fraction, as diagnosed by a physician. We assumed it be equivalent to Grade II or higher on the New York Heart Association Functional Scale.²³ We also added age-specific hospital discharge rate due to heart failure and prevalence of heart failure in the analysis to inform prevalence estimation. We modeled all types of data in DisMod-MR 2.0.

Results

We estimated the aetiological fraction of the 17 final GBD causes by year, sex, age, and country for 1990, 2005, 2010, and 2013.

Appendix Table E.8. - Aetiological fraction (percent) of different causes in both genders in all years combined for all ages combined (relative proportion of each cause, collapsed)			
Cause	Aetiological fraction	Cause	Aetiological fraction
Chagas	0.7	Hypertensive Heart Disease	15.8
Cardiomyopathy and myocarditis	11.8	Ischemic Heart Disease	30.4
COPD	9.5	Iodine deficiency	0.01
Congenital heart anomalies	1.1	Iron deficiency anemia	0.8
Endocarditis	0.4	Other circulatory	14.4
G6PD deficiency	0.03	Other endocrine, nutritional, blood, and immune disorders	1.2
Other hemolytic	0.3	Other interstitial lung disease	1.3
Rheumatic Heart Disease	11.1	Thalassemia	0.2

Pneumoconiosis	0.5	
Pneumoconiosis aetiological fractions, all years and ages combined		
Cause	Aetiological Fraction	
Other pneumoconiosis	56.7	
Asbestosis	1.9	
Silicosis	32.3	
Coal worker's pneumoconiosis	9.1	
Region comparison of prevalence of HF in different regions: males, 2013 Prevalence of HF in high income NA, males, 2013, with adjusted datapoints		

E.5 Infertility

We used DisMod-MR 2.0 and individual-level survey data to estimate the prevalence of primary, secondary, and all infertility among couples. Primary infertility is defined in a couple who have not had a live birth, who wish a child, and have been in a union for more than five years without using contraceptives. Secondary infertility is defined in a couple who wish a child and have been in a union for more than five years without using contraceptives since the last live birth. We included data were included for women in five-year age groups between 15 and 49 from surveys including the Demographic and Health Surveys (DHS), World Fertility Surveys (WFS), Reproductive Health Surveys (RHS), Family and Fertility Survey (FFS), and others (EUR, NSF, PCD, PFM). We extracted an additional 265 prevalence data points for primary infertility and 255 data points for secondary infertility from new surveys identified after the GBD 2010, bringing the total number of data points available for the GBD 2013 analyses to 1621 for primary infertility and 1575 for secondary infertility. Although these surveys only interviewed women, the resultant estimate of prevalence is an indicator of couples' infertility, as it is not possible to determine in a survey which partner is the cause of the infertility. Because some surveys ask questions of only ever-married women, we separately estimated the prevalence of four parameters, two each for primary and secondary infertility: 1) prevalence of exposure to infertility of that type; and 2) prevalence of infertility of that type among exposed women. We estimated primary and secondary couples' infertility from DisMod-MR 2.0 models by multiplying the estimates for prevalence of infertility among exposed women by the prevalence of exposure to infertility to obtain prevalence of infertility among all women and all men.

We expanded the GBD 2010 data set of 15 studies by adding 5 more on the proportion of infertile couples where the impairment is identified in the man and/or the woman.

We used DisMod-MR 2.0 to produce estimates of the proportion of primary and secondary infertility in men and women by region, age, and sex for 1990, 1995, 2000, 2005, 2010 and 2013. Because infertility in some couples is attributable to both partners rather than just one, the sum of the proportion of couples' prevalence due to male factor infertility and due to female factor infertility is greater than 1.

There are 7 identified causes of female infertility in the GBD 2013 cause list: chlamydia, gonorrhoea, other sexually transmitted diseases, maternal sepsis, polycystic ovarian syndrome, endometriosis, and Turner syndrome. For each of these diseases, we determined the prevalence of infertility by a literature review of the probability of becoming infertile due to that disease. For sexually transmitted diseases we applied a proportion with infertility derived from Westrom et al. (1992, Sex Transm Dis) to incident cases of pelvic inflammatory disease and streamed out prevalence over the fertile age range using DisMod-MR 2.0.²⁴ We added all the disease-specific estimates of prevalence and assigned the remaining proportion to categories of "female primary infertility due to other causes" and "female secondary infertility due to other causes." We assumed all infertility from Turner syndrome is primary infertility and all infertility following maternal sepsis is secondary infertility. The only recognised cause of male

infertility in the GBD 2013 cause list is Klinefelter syndrome. We assigned all other male infertility to “male infertility due to other causes”.

Prevalence and YLD by underlying cause for 1990 and 2013 and the prevalence of primary and secondary infertility are shown in Appendix table E.9. Appendix Table C9 provides our results of primary and secondary infertility: 63.4 million women in 2013 were infertile and 39.3 million men were infertile. In women less than a third is primary infertility and the majority is secondary infertility while in men primary infertility is about twice as common as secondary infertility. In women, the leading cause is the unexplained category but a major cause is polycystic ovarian syndrome affecting 22.4 million women. Collectively sexually transmitted diseases account for a further 3.7 million cases. Rates of infertility have remained stable between 1990 and 2013 but due to demographic changes, the number of infertile people in the world has increased by over 40%.

Appendix Table E.9: Prevalence and YLDs, with percent of total, for infertility by cause, 1990 and 2013, and prevalence of primary and secondary infertility by cause in 2013

	Sex	Total Prevalence (in thousands)		Total YLDs (in thousands)		Prevalence 2013 (in thousands)	
		1990	2013	1990	2013	Primary	Secondary
Male infertility due to other causes	Male	27,295.3 (39.04%)	39,265.7 (38.23%)	180.0 (30.23%)	258.6 (29.27%)	25,427.1 (24.76%)	13,838.5 (13.47%)
Klinefelter syndrome	Male	50.5 (0.07%)	76.7 (0.07%)	0.4 (0.06%)	0.6 (0.07%)	76.7 (0.07%)	-
Female infertility due to other causes	Female	21,992.4 (31.45%)	34,747.5 (33.83%)	122.3 (20.54%)	191.9 (21.72%)	7,214.4 (7.02%)	27,533.1 (26.81%)
Polycystic ovarian syndrome	Female	14,552.2 (20.81%)	22,376.7 (21.79%)	212.3 (35.66%)	327.0 (37.01%)	9,751.6 (9.49%)	12,625.0 (12.29%)
Maternal sepsis and other maternal infections	Female	1,921.0 (2.75%)	1,677.6 (1.63%)	9.6 (1.61%)	8.4 (0.95%)	-	1,677.6 (1.63%)
Gonococcal infection	Female	1,342.5 (1.92%)	1,517.4 (1.48%)	8.0 (1.35%)	9.1 (1.03%)	655.2 (0.64%)	862.3 (0.84%)
Chlamydial infection	Female	1,098.0 (1.57%)	1,090.3 (1.06%)	6.5 (1.10%)	6.5 (0.74%)	447.8 (0.44%)	642.4 (0.63%)
Other sexually transmitted diseases	Female	1,098.0 (1.57%)	1,090.3 (1.06%)	6.5 (1.10%)	6.5 (0.74%)	447.8 (0.44%)	642.4 (0.63%)
Endometriosis	Female	490.6 (0.70%)	736.9 (0.72%)	49.1 (8.25%)	74.0 (8.38%)	316.5 (0.31%)	420.4 (0.41%)
Turner syndrome	Female	80.8 (0.12%)	127.3 (0.12%)	0.6 (0.10%)	0.9 (0.11%)	127.3 (0.12%)	-
Total Prevalence	Both	69,921.2 (100.00%)	102,706.2 (100.00%)	-	-	44,464.5 (43.29%)	58,241.7 (56.71%)
Total YLDs	Both	-	-	595.4 (100.00%)	883.5 (100.00%)	443.1 (50.15%)	440.5 (49.85%)

E.6 Intellectual disability

We modelled the prevalence estimates of intellectual disability (ID), both aetiology-specific IDs and idiopathic ID, over multiple steps. First, we ran a DisMod-MR 2.0 model to estimate the total prevalence estimates of all aetiology IDs defined as anyone with IQ below 70 (envelope ID). As data points were rather sparse, we used two country-level fixed effect covariates to inform DisMod-MR 2.0 to extrapolate estimates to missing country-years: log-

transformed lag distributed income per capita, and year. Appendix Figure C5 provides an example of DisMod-MR 2.0 model showing the data points in gray and prevalence estimates at regional level in purple.

Appendix Figure E.1.: Prevalence of intellectual disability in East Asia for females in 2005

We estimated prevalence of each aetiology-specific ID by models from the parent causes provided in Appendix Table C10. We calculated prevalence of idiopathic ID by subtracting all aetiology-specific IDs from the envelope and assuming the residuals to represent idiopathic. The issue arises here when this subtraction leaves no residual or even becomes negative (i.e. total prevalence of aetiology-specific ID exceeds the envelope ID). In order to have a plausible set of prevalence estimates between the envelope ID, idiopathic ID, and all aetiology-specific IDs, we made an assumption that idiopathic ID should be no less than 5% of total prevalence of envelope ID for any country-year-sex-age, at the 1000 draws level. When a subtraction left less than 5% of the envelope, the prevalence of all aetiology-specific IDs were proportionally squeezed to fit within 95% of the envelope, leaving 5% for idiopathic ID.

As we estimated the prevalence of individual aetiology-specific IDs by models from the respective parent causes, the squeezing may result in a distorted balance of prevalence estimates within their parent causes. With the aim to maintain consistencies of prevalence within each of the parent causes, we added the difference between the original and the squeezed prevalence estimates to the ‘motor impairment’ sequela if the squeezed sequela represented ‘motor and cognitive impairment.’ For autism, we obtained the fraction of cases that result in ID from literature (0.29; 0.27-0.30 CI 95%) and applied to the subtraction and squeezing processes.

We further split the total prevalence of idiopathic ID estimated in the previous step into four severity levels: mild (IQ 50-69), moderate (IQ 35-49), severe (IQ 20-34), and profound (IQ below 20). In calculating the fractions of these four severity levels, we pooled a subset of data used for estimating the ID envelope if the source distinguished cases by these severity levels. We did this by pooling fractions of three cumulative severity levels (i.e. IQ <50, IQ<35, IQ<20) to maximize the number of sources. We extrapolated the prevalence of the fifth category of borderline (IQ 70-84) from the envelope (IQ below 70) prevalence by applying pooled ratios between the two obtained from a subset of sources that provided both of these prevalent cases. In splitting or extrapolating these five severity levels, we separately pooled fractions or ratios for high-income countries and low and middle-income countries. The uncertainty of the pooled fractions and ratios were propagated throughout our calculations using 1000 draws assuming beta distributions parameterised by 95% confidence intervals provided during the pooling process.

Appendix Table E.10. - Causes that include intellectual disability as sequelae

Neonatal preterm birth complications (<28w, 28-32w, 32-36w)
Neonatal encephalopathy due to birth asphyxia and trauma
Hemolytic disease and other neonatal jaundice
Meningitis (pneumococcal, H influenza type B, meningococcal, other bacterial)
Encephalitis
Malaria
Neonatal tetanus
Iodine deficiency
African trypanosomiasis
Stroke (hemorrhagic, ischemic)
Down syndrome
Klinefelter syndrome
Chromosomal unbalanced rearrangements
Neural tube defects
Hypertensive disorders of pregnancy (eclampsia, preeclampsia)
Autism
Fetal alcohol syndrome

Before splitting the idiopathic ID prevalence into four severity levels using the fractions, we adjusted the severity distributions to account for some aetiology-specific IDs that have skewed distributions. We assumed all ID cases due to iodine deficiency (cretinism) to result in either severe or profound level, and Klinefelter syndrome cases that result in ID will have either borderline or mild level. While we estimated the prevalence of Klinefelter syndrome for each severity level by the parent model, we split prevalence of cretinism into two severity levels assuming the ratio between the two fractions estimated above. We first multiplied the 1000 draws from the envelope ID by the 1000 draws of each severity fraction to obtain the envelope ID prevalence in four levels of severities. We then subtracted the prevalence of cretinism and Klinefelter syndrome from the corresponding severity levels of the envelop ID, and recalculated the fractions of each severity at the draw level. After these adjustments, we applied those fractions to the 1000 draws of idiopathic ID to obtain the prevalence in four severity levels.

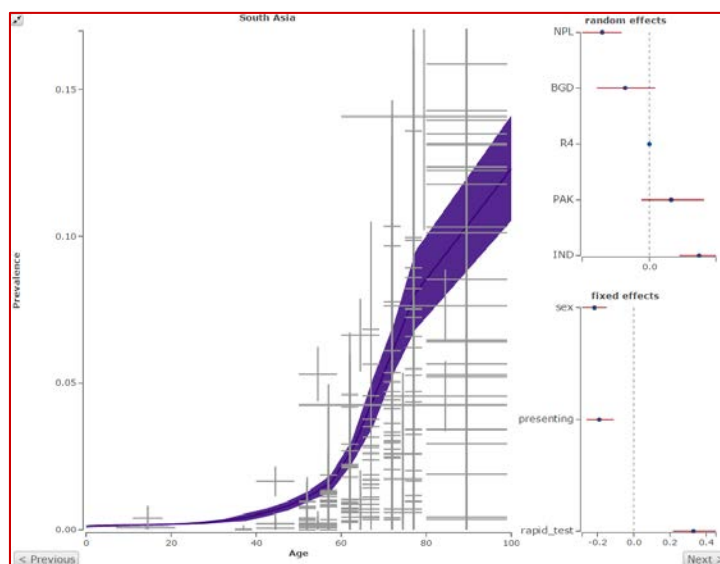

E.7 Vision impairment

We modelled the prevalence of vision loss in three steps. In the first step, we ran four DisMod MR 2.0 models to estimate the total prevalence estimates of vision impairment and blindness: moderate vision impairment, severe vision impairment, blindness, and near vision impairment (presbyopia). Appendix Figure C6 provides an example of DisMod-MR 2.0 models showing the data points in gray and prevalence estimates at regional level in purple. We directly derived prevalence of presbyopia from DisMod MR 2.0, whereas the remaining three models that reflect different severity levels of distance vision loss continued to the next step.

In the second step, we removed the uncorrected refractive error from the prevalence estimates obtained from DisMod-MR 2.0 models in the preceding step. We first identified what proportion of distance vision loss was due to under-correction of refractive error. Refractive error results in blurry vision and can cause vision loss. The blurriness caused by refractive error can be addressed through the use of contact lenses, glasses, or refractive surgery.

However, a large proportion of people with vision loss due to refractive error do not have these corrective devices or procedures.

Appendix Figure E.2: Prevalence of blindness in South Asia for females in 2013

We identified studies that reported both presenting and best-corrected estimates of vision loss. We used these data to estimate region and age-specific coefficients that capture the relationship between presenting vision loss and best-corrected. We ran a logit transformed regression by using the ratio of best-corrected over presenting as the dependent variable. After testing various sets of covariates, only age and South Asia region covariates provided statistically significant coefficients, and hence were included in the model. We deemed data points with best-corrected ratios of less than 0.3 to be outliers and we excluded them from the analysis. We then used those estimated coefficients to split the prevalence of vision impairment and blindness into uncorrected refractive error and best-corrected. We obtained the prevalence estimates of uncorrected refractive error for three severity levels from this step. The best-corrected prevalence of distance vision loss was subject for further analysis.

In the third step, we estimated the prevalence of vision loss due to multiple causes: cataract, glaucoma, macular degeneration, diabetic retinopathy, retinopathy due to prematurity, trachoma, vitamin A deficiency, onchocerciasis, and other causes not classified elsewhere. For blindness, we also accounted for other causes such as meningitis, neonatal tetanus, neonatal preterm birth complications, neonatal encephalopathy, hemolytic disease, etc. We implemented proportional squeezes to scale cause-specific vision loss prevalence to the total prevalence of best-corrected vision loss for each of the three severity levels.

Although total prevalence estimates for vision impairment changed little from the GBD 2010 to the GBD 2013, specific prevalence estimates for cataract and for macular degeneration both decreased by 36% and 34%, respectively, from the GBD 2010 to the GBD 2013. These decreases resulted from a change in strategy for estimating the prevalence of each major underlying cause of vision impairment. In the GBD 2013, we modelled the major underlying causes of vision impairment using DisMod-MR 2.0 as prevalence rates rather than proportions of the total of vision impairment as we did in the GBD 2010. This allowed for better use of survey data that did not specify all major causes of vision impairment. This change revealed a potential underestimation of vision impairment due to uncorrected refractive error in the GBD 2010. To amend this underestimation, we increased the share of uncorrected refractive error in the total vision impairment burden in the GBD 2013 which resulted in decreased prevalence for all other vision impairment causes, including cataract and macular degeneration, in the GBD 2013.

E.8 Guillain-Barré syndrome

Guillain-Barré syndrome is a rare condition that usually occurs as a complication of respiratory or gastro-intestinal infection. It is considered an immune-mediated nerve dysfunction with rapid onset of weakness in feet and hands ascending towards the trunk. In the acute phase about a quarter of cases required mechanical ventilation for survival. The majority of cases fully recover within months to a year. In the GBD 2013, in DisMod-MR 2.0 we used 156 incidence data points from 26 countries representing 9 of 21 GBD regions and four remission data points from 4 countries in 3 GBD regions. We estimate a global incidence of just under 1 per 100,000 and global prevalence of just over 0.5 per 100,000, consistent with remission of 1.8 or an average duration of 6.7 months.

There were 35 studies that provided information on the underlying cause: 31 mentioning all of the identified underlying infectious diseases; 26 providing a proportion for upper respiratory infections, 3 for influenza, 25 for diarrheal disease and 14 for other infectious diseases. We used random effects meta-analysis to pool these proportions (Appendix Table E.11.) and stream out 1,000 draws assuming a binomial distribution around the pooled mean. At the draw level we assign the complement to one of the proportion with any underlying infectious disease to a rest category of 'idiopathic Guillain-Barré syndrome' that is classified under neurological disorders. Also, at the draw level we squeeze the proportions for influenza, diarrheal diseases, upper respiratory infections and other infectious diseases to add to the proportion for all identified infectious underlying diseases.

Appendix Table E.11. - Pooled proportions of Guillain-Barré syndrome by underlying cause			
	Mean (%)	Lower limit (%)	Upper limit (%)
All specified causes	61.70	56.50	66.90
Upper respiratory infections	39.90	33.70	46.20
Influenza	14.60	7.90	22.70
Diarrheal diseases	13.80	11.00	16.90
Other infections	8.90	6.50	11.50

Appendix Table E.12. shows prevalence and YLDs for Guillain-Barré syndrome by cause.

Appendix Table E.12. Prevalence and YLDs for Guillain-Barré syndrome by cause, 1990 and 2013				
	Total Prevalence (in thousands)		Total YLDs (in thousands)	
	1990	2013	1990	2013
Upper respiratory infections	8.4 (34.70%)	12.2 (34.63%)	2.5 (34.71%)	3.6 (34.64%)
Other neurological disorders	8.0 (32.76%)	11.6 (32.90%)	2.4 (32.76%)	3.4 (32.90%)
Lower respiratory infections	3.1 (12.76%)	4.5 (12.73%)	0.9 (12.76%)	1.3 (12.73%)
Diarrheal diseases	2.9 (12.02%)	4.2 (12.00%)	0.9 (12.02%)	1.3 (12.00%)
Other infectious diseases	1.9 (7.76%)	2.7 (7.74%)	0.6 (7.75%)	0.8 (7.74%)
Total Prevalence	24.3 (100.00%)	35.3 (100.00%)	-	-

Total YLDs	-	-	7.2 (100.00%)	10.4 (100.00%)
------------	---	---	------------------	-------------------

E.9 Pelvic inflammatory disease

In the GBD 2013, we estimated incidence of pelvic inflammatory disease (PID) using inpatient and outpatient hospital data, assuming the ratio of hospital visits to persons not presenting for care is consistent. We also used this ratio to guide the assignment of PID as either moderate or severe. Disability weights for these health states did not appreciably change. In the GBD 2013, in order to estimate the proportion of all PID due to chlamydia, gonorrhea, and other STI, we improved on the GBD 2010 method by modelling all available PID aetiology data as proportions in DisMod-MR 2.0. This approach resulted in estimates for each aetiology of PID having greater geographic variation than was present previously in the GBD 2010.

Appendix Table E.13. shows prevalence and YLDs for PID by cause in 1990 and 2013 and 2013 prevalence by severity.

Appendix Table E.13. Prevalence and YLDs for pelvic inflammatory disease by cause, 1990 and 2013, and prevalence by severity in 2013						
	Total Prevalence (in thousands)		Total YLDs (in thousands)		Prevalence 2013 (in thousands)	
	1990	2013	1990	2013	Moderate	Severe
Other sexually transmitted diseases	125.5 (47.18%)	160.0 (54.07%)	16.8 (46.95%)	21.4 (53.83%)	142.3 (48.09%)	17.7 (5.98%)
Gonococcal infection	78.0 (29.33%)	79.8 (26.97%)	10.4 (29.20%)	10.7 (26.96%)	71.1 (24.01%)	8.8 (2.97%)
Chlamydial infection	62.5 (23.49%)	56.1 (18.96%)	8.5 (23.85%)	7.6 (19.21%)	49.9 (16.87%)	6.2 (2.09%)
Total Prevalence	266.1 (100.00%)	296.0 (100.00%)	-	-	263.3 (88.96%)	32.7 (11.04%)
Total YLDs	-	-	35.7 (100.00%)	39.7 (100.00%)	29.1 (73.34%)	10.6 (26.66%)

Appendix F: Differences in estimates for the year 2010 between GBD 2010 and GBD 2013 studies

1. Tuberculosis

YLD estimates for tuberculosis decreased by 47% (from 6,777,400 to 3,545,343 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

In the GBD 2010, we estimated tuberculosis mortality and then estimated population incidence through mixed effects regression as a function of tuberculosis mortality, case-notifications, and an indicator variable for health system access used as a proxy for completeness of registration.

In the GBD 2013, we shifted to using all available data for different outcomes and simultaneously estimating incidence, remission, excess mortality, prevalence, and cause-specific mortality using the GBD Bayesian meta-regression tool, DisMod-MR 2.0. To estimate national levels and trends for tuberculosis in a country, we included four sources of information: annual case notifications, expert judgment on the case-detection rate, prevalence surveys, and cause of death data. Additionally, to facilitate convergence of the meta-regression, we used estimated excess mortality and remission rates. Given that incidence, prevalence, and mortality might be measured imperfectly, this new approach is predicated on the theory that a statistical triangulation of all sources for a country will provide a more robust assessment. We performed our meta-regression analysis for all forms of tuberculosis. As a final step, we estimated incidence, prevalence, and death in individuals who are HIV-positive and those who are HIV-negative. This is further described in Murray et al.²⁵

YLD estimates decreased by 47% between the GBD 2010 and the GBD 2013 largely due to changes in the estimation of incidence and prevalence in the South Asia and East Asia GBD regions. In the GBD 2010, we only included notification data by age and sex for Bangladesh and China in a single year. All other data sources were for all ages combined. In the GBD 2013, however, we incorporated age-sex specific data for all countries in the regions which led to a halving of modelled incidence and which, in turn, led to a halving of the prevalence estimates. As the South Asia and East Asia regions contribute close to half of global cases, it led to a substantial reduction in global estimates. The volume of incidence data points in just these two regions increased from 73 in the GBD 2010 to 2,750 in the GBD 2013 and the number of prevalence data points in the two regions increased from 6 to 2,855.

2. HIV/AIDS resulting in mycobacterial infection

YLD estimates for HIV/AIDS resulting in mycobacterial infection decreased by 76% (from 1,224,026 to 289,898 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

For the GBD 2010, we primarily used estimates of prevalence and mortality developed by UNAIDS. The main modification was the requirement that the sum of cause-specific mortality from each cause in a country, age, sex, and year group equaled the estimate of all-cause mortality for that country, age, and sex group generated through the analysis of demographic sources. Modifications of HIV deaths through this internal consistency process did not lead to revisions of incidence or prevalence for HIV in a particular age-sex-country-year. For the GBD 2013, however, we sought to develop a set of estimates of incidence, prevalence, and mortality from HIV that are internally consistent with each other and also meet the GBD requirement that the sum of each cause of death equals all-cause mortality. Internally consistent means the incidence, prevalence, and death figures are mathematically possible given that prevalence is a function of past incidence, remission, and death rates for any age cohort.

3. Upper respiratory infections

YLD estimates for upper respiratory infections (URI) increased by 60% (from 1,730,273 to 2,724,690 YLDs) from the GBD 2010 to the GBD 2013 due to changes in classifications and proportions of mild and moderate URI. This change is not significant.

In the GBD 2010, we used pharyngitis as a proxy for moderate URI, epiglottitis as a proxy for severe URI, and the remaining proportion was considered mild URI. In the GBD 2013, we classified nasopharyngitis, or common cold, as mild URI and acute pharyngitis, tonsillitis, laryngitis, sinusitis, and epiglottitis as moderate URI. We no longer kept severe URI as a separate category as we did in the GBD 2010 since the proportion of epiglottitis was very small. Overall, these changes contributed to a lower proportion of mild URI and a higher proportion of moderate URI. For example, the severity distribution of URI for children aged 0 to 4 years in the GBD 2010 were: mild URI (90.97%), moderate URI (9.00%) and severe URI (0.03%). The severity distribution for children aged 0 to 4 years for the GBD 2013 were: mild URI (84.75%) and moderate URI (15.25%) respectively. These changes resulted in higher YLD estimates for URI in the GBD 2013.

4. Otitis media

YLD estimates for otitis media decreased by 62% (from 4,440,092 to 1,666,540 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

In the GBD 2010, hearing loss due to otitis media was assumed to have the same distribution as other causes of hearing loss on literature²⁶ suggesting a distribution of hearing loss at mild and moderate levels only. This led to much lower estimates. We also added two new health states which has an opposite effect of adding some YLD: vertigo and the rarer occurrence of serious infectious complications, brain abscess, meningitis and mastoiditis, but the latter have limited duration and therefore contribute less to changes in YLD, despite their severity.

4. Meningitis

Meningococcal meningitis

Other meningitis

YLD estimates for meningitis decreased from the GBD 2010 to the GBD 2013. Specifically, YLD estimates for meningococcal meningitis decreased by 61% (from 406,159 to 158,594 YLDs) and YLD estimates for other meningitis decreased by 53% (from 933,524 to 435,391 YLDs). These changes are significant.

In the GBD 2010, we estimated hearing loss due to bacterial meningitis using data from hearing loss studies that also reported meningitis as one of the underlying aetiologies. Using the same data in the GBD 2013 revealed that the estimated prevalence became implausibly high compared to the meningitis incidence. Therefore, in the GBD 2013, we modelled hearing loss due to meningitis using data from a meta-analysis study that investigated the long-term sequelae of meningitis, including hearing loss.²⁷ The decline in YLDs between the GBD 2010 and the GBD 2013 can also be attributed to the case fatality data we used for modelling long-term sequelae. In the GBD 2010, we used from a meta-analysis a single pooled estimate for all regions/ year/ age/ sex. In the GBD 2013, we estimated excess mortality from case fatality rates specific to regions/ year/ age/ sex. This led to a lower estimation of long-term prevalence in meningitis-endemic regions in the GBD 2010.

5. Dengue

YLD estimates for dengue increased by 3203% (from 12,183 to 439,329 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

The addition of post-acute chronic fatigue as a sequela, with an associated health state of “infectious disease, post-acute consequences (fatigue, emotional lability, insomnia)” explains most of the large increase in dengue YLD since the GBD 2010.

The other reason is a change in the method of correcting for underreporting. In the GBD 2010, we accounted for underreporting by assuming complete dengue reporting in high income countries with good access to care and increasing underreporting in countries with less access based on our composite indicator of health system access. In the GBD 2013, we adopted a new approach of benchmarking country-level deviations from expected values (based on new dengue risk maps from Bhatt et al [2013]) against published estimates of empirical correction factors for underreporting.²⁸

6. Yellow fever

YLD estimates for yellow fever increased by 5231% (from 4 to 81 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

A recent analysis by Johansson, Vasconcelos and Staples (2014) provided compelling evidence that reported cases underestimate true cases of yellow fever.²⁹ However, little recent data exists on the degree of underreporting of yellow fever. Therefore, for GBD 2013, we used data on underreporting of dengue as a proxy for underreporting of yellow fever and inflated reported cases accordingly. Based on the same analysis we also estimated a proportion of cases to be asymptomatic cases which has the opposite effect of lowering estimates.

7. Hookworm disease

YLD estimates for hookworm disease decreased by 34% (from 3,232,065 to 2,098,711 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

Changes in burden estimates for anemia due to hookworm disease resulted in changes in the burden of hookworm disease from the GBD 2010 to the GBD 2013. For details regarding hookworm disease modelling changes, please refer to the description of methods for calculating the burden of anemia on page 6.

8. Food-borne trematodiasis

YLD estimates for food-borne trematodiasis (FBT) increased by 93% (from 1,875,473 to 3,539,950 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

This increase can be attributed to the following modifications to the modelling strategy.

Firstly, in the GBD 2013, we increased the disability weights for paragonimiasis and cerebral paragonimiasis. In the GBD 2010, we applied the disability weight for moderate abdominal pain (0.11) to all FBT cases. In the GBD 2013, however, since symptoms of paragonimiasis and cerebral paragonimiasis do not match moderate abdominal pain, we used more appropriate weights for TB and epilepsy, respectively. As a result, YLD estimates for paragonimiasis and cerebral paragonimiasis are three times higher.

Secondly, we used different input data for DisMod-MR between the GBD 2010 and the GBD 2013. In the GBD 2010, following a literature review and an in-depth analysis, the GBD experts provided the input data. We then pre-modelled the data (e.g. applying standardised age and sex profiles and using DisMod-MR). In the GBD 2013, however, we used raw data from studies that reported national prevalence rates of FBT as the input for DisMod-MR 2.0.

Thirdly, we modified how we applied prevalence rates across countries within the same GBD region. In the GBD 2010 study, we assumed the prevalence rate for all countries in a particular GBD region was the same. For example, we applied the prevalence rate of *Clonorchiasis sinensis* in Russia to all other countries in the Eastern Europe region (Belarus, Estonia, Latvia, Lithuania, Moldova, and Ukraine) as their national prevalence rates were unavailable. For the GBD 2013, however, we did not adopt the same rate across all countries in a region, but rather limited estimates to only those countries for which national prevalence rates were available. We chose not to include countries in close geographic proximity because infection is highly dependent on the ingestion of certain types of food and close geographic proximity does not infer similar food habits.

Fourthly, we modified how we calculated the rates of high infection. In the GBD 2010, we applied one rate, based on literature, to assess the number of persons with high infection. In the GBD 2013, however, we expected rates of high infection to increase with age. Therefore, we included age-dependent rates of high infection for clonorchiasis, opisthorchiasis, and intestinal fluke infection (but not for [cerebral] paragonimiasis and fascioliasis, as there were insufficient data on high intensity infection by age or sex category for these diseases). This change in approach resulted in higher percentages of cases with high intensity infection, particularly for clonorchiasis and opisthorchiasis.

9. Chagas disease

YLD estimates for Chagas disease decreased by 70% (from 306,778 to 89,982 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

In the GBD 2010, the prevalence of sequelae were not constrained to add up to estimates of the total Chagas prevalence. In the GBD 2013, we revised our approach by using age-specific relative risks for each sequela, rather than the GBD 2010 approach which assigned a defined proportion of cases to each age group regardless of the underlying population structure. We also re-evaluated our approach to estimating cardiovascular sequelae. We no longer assign disability to common but asymptomatic electrocardiography (ECG) abnormalities but restrict our cardiovascular estimates to heart failure and atrial fibrillation. Moreover, based on the results of a recent study by Ribeiro et al (2014), in the GBD 2013, we reduced our estimate of the prevalence of atrial fibrillation among those with Chagas.³⁰

10. Leishmaniasis

YLD estimates for leishmaniasis decreased by 62% (from 124,306 to 45,670 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

The majority of YLD from leishmaniasis are due to cutaneous rather than visceral leishmaniasis. The main difference is that in the GBD 2013, we excluded seroincidence and seroprevalence data used in the GBD 2010 which resulted in lower incidence and prevalence estimates.

11. Cysticercosis

YLD estimates for cysticercosis decreased by 32% (from 456,627 to 313,146 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

In the GBD 2010 estimates of epilepsy arising from various diseases in the GBD schedule were left unconstrained. In GBD 2013, we constrained these estimates not to exceed the estimated burden of secondary epilepsy which is derived from the prevalence estimates of the epilepsy ‘envelope’ model multiplied by output from a second DisMod-MR 2.0 model of the proportions of epilepsy that are ‘idiopathic’ or secondary.

12. Onchocerciasis

YLD estimates for onchocerciasis increased by 149% (from 493,801 to 1,254,856 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

In the GBD 2010 and the GBD 2013, we based the burden estimates for onchocerciasis on the same prevalence estimates. However, in the GBD 2010, the disability weights for the skin manifestations failed to account for itch (one of the most prevalent manifestations of onchocerciasis). Based upon consultation with collaborating experts, we switched to using higher disability weights for the disfigurement of skin lesions that are accompanied by itch in the GBD 2013. Also, unlike in the GBD 2010, we included the most severe level skin sequelae for hanging groin, lichenified onchodermatitis with confluent plaques, and chronic papular onchodermatitis with scratch marks, further contributing to increases in YLDs.

13. Maternal sepsis and other maternal infections

YLD estimates for maternal sepsis and other maternal infections decreased by 45% (from 41,298 to 22,865 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

While we adopted a similar strategy for estimating maternal sepsis and other maternal infections between the GBD 2010 and the GBD 2013, two differences contributed to the decrease in YLD estimates. First, for all maternal conditions we have a mix of hospital inpatient data for high income and Latin American countries from which we generally derive population rates. Another source is data from the literature which typically reports cases per 1,000 live births. To be able to include both sets of data we converted the hospital rates to a ratio per 1,000 live births and ran DisMod-MR 2.0 with all data in this format. The results from DisMod-MR 2.0 are afterwards back-transformed to population rates using data on age-specific fertility rates by country, year and age. In the GBD 2010 this last back-transformation to population rates was not done and that led to overestimation.

The second change concerns a disaggregation into two types of maternal infections. ICD-10 includes a range of infections temporally associated with pregnancy, but not traditionally thought of as puerperal in nature. Examples include wound infections, vaginal tract infections, cystitis/ pyelonephritis and mastitis. In the GBD 2013, split the two into separate models: puerperal sepsis and “other maternal infections”. The GBD 2013 disability weight for severe infection used for puerperal sepsis is 0.133 while in the GBD 2010 the disability weight for severe abdominal pain was used with a much higher value of 0.326. The cases of ‘other maternal infections’ were given the disability weight for moderate infection, at about half the value of the severe infection disability weight. Unlike in the GBD 2010, we did include secondary infertility after maternal sepsis as a sequela assuming the same proportion of cases develops infertility as reported for pelvic inflammatory disease by Weström et al (1992).²⁴

14. Maternal hypertensive disorders

YLD estimates for maternal hypertensive disorders decreased by 32% (from 92,524 to 63,634 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

While we adopted a similar strategy for estimating maternal hypertensive disorders between the GBD 2010 and the GBD 2013, one key difference contributed to the change in estimates. For all maternal conditions we have a mix of hospital inpatient data for high income and Latin American countries from which we generally derive population rates. Another source is data from the literature which typically reports cases per 1,000 live births. To be able to include both sets of data we converted the hospital rates to a ratio per 1,000 live births and ran DisMod-MR 2.0 with all data in this format. The results from DisMod-MR 2.0 are afterwards back-transformed to population rates using data on age-specific fertility rates by country, year and age. In the GBD 2010 this last back-transformation to population rates was not done and that led to overestimation.

15. Complications of abortion

YLD estimates for complications of abortion decreased by 93% (from 32,371 to 2,312 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

We estimated complications of abortive outcome of pregnancy, which includes ectopic pregnancy and induced abortions, using hospital datasets as the primary input. In the GBD 2010, this category also included spontaneous miscarriages, but due to inconsistent reporting of this phenomenon and that it would not be expected to result in disability of the nature seen in other maternal complications, we excluded it from the GBD 2013 analysis. In the GBD 2013, we also did not include Demographic and Health Survey data sources due to a lack of differentiation of spontaneous from induced abortion. We modeled the number of abortions per live birth in DisMod-MR 2.0. We then used three study-level covariates to crosswalk systematic differences in the datasets: 1) those data that only included induced abortions (i.e. excluded ectopic), 2) those data collected in hospitals which are not likely representative of the entire population, and 3) data from those countries where abortion is considered illegal under all circumstances and therefore any induced abortions that may occur are not reported. We used age-standardised abortive outcome mortality rate from the GBD 2013 cause-of-death analysis and whether or not on-demand abortion is legal (*Abortion On-Demand Illegal [binary]*), as country-level covariates to predict incident cases. After standardization to the population level, we calculated prevalent cases and disability from abortion, assuming 3 days (2 – 4 days) duration of moderate abdominopelvic problem. Similar to what is noted for maternal sepsis and hypertensive disorders in pregnancy, in the GBD 2010 a back-transformation between rates per live births was left out and this led to overestimation.

16. Preterm birth complications

YLD estimates for preterm birth complications increased by 102% (from 2,980,505 to 6,009,271 YLDs) from the GBD 2010 to the GBD 2013, a significant increase. This change is significant.

We calculated preterm birth complications by starting with birth prevalence by three gestational age categories (<28 weeks; 28-31.9 weeks; and 32-36.9 weeks). We subtracted the proportion of cases dying in the first month and multiply by a probability of long-term mild motor and cognitive impairment and those with more severe long-term motor and/or cognitive impairments with or without blindness or seizures.

In the GBD 2010, we derived these probabilities from a meta-analysis within three strata of countries based on their neonatal mortality rate (<5; 5-14 and 15+ per 1,000 live births). In the GBD 2013 we ran mixed effect models by the same gestational age categories to pool birth prevalence, case fatality proportion and probabilities of mild or more severe long term impairments using the log of countries' neonatal mortality rate and year as fixed effects and random effects on three levels of geography (super-region, region, and country). In sparser data sets we dropped country and/or region random effects. In the sparsest models we resorted to meta-analysis. This change in modelling strategy led to 121% higher estimates of 2010 prevalence in the GBD 2013 as changes over time were inadequately picked up using the coarse binning of countries into three categories, rather than using neonatal mortality rate as a continuous variable. As birth prevalence of preterm births has been increasing and case fatality has been dropping over time and the probability of long term impairments has not changed much, prevalence estimates increased a lot, particularly in latter years compared to the GBD 2010 estimates. YLDs increased by a lower proportion (102%) than prevalence estimates as we forced estimates of epilepsy and intellectual disability, as sequelae of preterm birth complications, to fit within the 'envelope' of the total impairments. In the GBD 2010, we did not include this step. As intellectual disability and epilepsy occur together with motor impairment we decided to recategorise cases that exceeded the envelope of either impairment as having motor impairment only. The disability weights for moderate and severe motor impairment only are quite a bit lower than those for moderate and severe motor plus intellectual impairments or the combined states of motor impairments and epilepsy.

17. Neonatal encephalopathy due to birth asphyxia and trauma

YLD estimates for neonatal encephalopathy due to birth asphyxia and trauma decreased by 62% (from 6,146,716 to 2,318,108 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

The GBD 2010 estimates for neonatal encephalopathy were hindered by not having access to the primary data. As a result, we based estimates on a regression equation provided by GBD experts. In the GBD 2013, we used the same strategy as for preterm birth complications: mixed effects models predicting country values of birth prevalence, 28-day case fatality proportion and probabilities of long term impairments with the log of countries' neonatal mortality rate and year as fixed effects and random effects on geography. The prevalence estimates for the year 2010 decreased by 31% compared to the GBD 2010 estimates. YLDs dropped further (by 62%) after we implemented the same 'squeeze' on intellectual disability and epilepsy as mentioned above for preterm birth complications.

18. Neonatal sepsis and other neonatal infections

YLD estimates for neonatal sepsis and other neonatal infections decreased by 76% (from 22,900 to 5,877 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

We estimated prevalence of neonatal sepsis from deaths and a mixed-effects models predicting case fatality proportions based on data for neonatal meningitis (note: we modelled neonatal meningitis separately as part of the meningitis model for all ages). Compared to the GBD 2010, birth prevalence dropped by 67%, partly because deaths from neonatal sepsis dropped by 36% and partly because we assumed a shorter duration (2 vs 4 weeks) based on expert advice.

19. Iodine deficiency

YLD estimates for iodine deficiency decreased by 46% (from 3,891,254 to 2,063,276 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

Despite universal iodization of salt in many countries, the GBD 2010 results did not reflect a decreasing trend in the prevalence of iodine deficiency over time. In the GBD 2013, we addressed this issue by setting the "Proportion of households using iodised salt (adjusted)" covariate to be negatively associated with iodine deficiency and also by adding a year covariate. This change resulted in lower prevalence and YLD estimates for iodine deficiency in the GBD 2013.

20. Vitamin A deficiency

YLD estimates for vision loss due to vitamin A deficiency decreased by 80% (from 806,779 to 161,690 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

Given a massive global scale up of vitamin A supplementation in recent years, this decline seems realistic. To take into account the intervention coverage, in the GBD 2013, we added a country-level covariate, “Vitamin A supplementation coverage rate,” not previously included in the GBD 2010. We used additional covariates including: *Vitamin A Deficiency Prevalence (age-standardised)*, (serum retinol < 70 µmol/L), and a year covariate. In the GBD 2010, we assumed zero prevalence of corneal ulceration and corneal scar due to vitamin A deficiency in high income countries. In the GBD 2013, however, we assumed zero prevalence of these conditions for countries in the Eastern Europe and Central Europe GBD regions in addition to high income countries. These changes combined resulted in the lower prevalence and YLD of vision loss due to vitamin A deficiency in the GBD 2013.

21. Syphilis

YLD estimates for syphilis decreased by 35% (from 93,863 to 57,979 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

In the GBD 2010 and the GBD 2013, we estimated disability due to tertiary syphilis only. This includes combined disability of cardiovascular syphilis, neurosyphilis, and late benign syphilis. We assumed disability associated with primary and secondary syphilis was insignificant as both disease phases are generally subtle and asymptomatic.

We used similar data sources in the GBD 2010 and the GBD 2013. We primarily used hospital data to estimate prevalence of tertiary syphilis in countries where reliable inpatient data is available. We made a few key changes to model specifications since the GBD 2010, which had an impact on the magnitude of prevalence and YLD estimates in the GBD 2013. 010, we defined the duration of syphilis as 15 years. In the GBD 2013, we set remission and excess-mortality each to have a maximum value of 0.1 per person-year. This functionally set the minimum duration at 5 years but did not specify an upper bound. Additionally, in the GBD 2013, updates to cause-specific mortality data and the syphilis seroprevalence covariate were marginally lower than estimated in the GBD 2010, which decreased the magnitude of our adult tertiary syphilis prevalence estimates.

22. Acute hepatitis B

YLD estimates for acute hepatitis B decreased by 30% (from 246,679 to 160,452 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

Our overall estimates of the number of acute hepatitis B cases did not change substantially from the GBD 2010 to the GBD 2013; however, our YLD estimates in the GBD 2013 were notably lower than those from the GBD 2010. The decline in YLDs was driven by changes in our method for assigning cases to symptomatic and asymptomatic states: we improved our approach in this regard and in the GBD 2013 used age-specific estimates for the proportion of cases that were symptomatic, rather than a fixed proportion for all ages. This reduced the proportion of cases that were symptomatic in younger age groups and, consequently, reduced our overall YLD estimates.

23. Acute hepatitis C

YLD estimates for acute hepatitis C decreased by 57% (from 39,208 to 16,444 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

This change is driven completely by a change in the estimates of prevalence. In the GBD 2010 and the GBD 2013, we estimated the incidence of hepatitis C infection using DisMod, based on anti-HCV (hepatitis C virus) seroprevalence data. This compartmental model estimated incidence as a function of duration and changes in prevalence. We set priors on excess mortality due to hepatitis C which influenced duration and, in turn, our estimates of incidence. In the GBD 2013, we conducted a literature review and found the previous prior used in the GBD 2010 was based on sources that disproportionately included individuals with advanced and symptomatic hepatitis C infections. Therefore, we reduced our prior for excess mortality in the GBD 2013 based on data published by El-Kamary, Jhaveri and Shardell (2011) that we believe are based on a more representative sample of people infected with hepatitis C.³¹ This reduction in the prior for excess mortality in the GBD 2013 yielded lower incidence estimates than in the GBD 2010.

24. Leprosy

YLD estimates for leprosy increased by 560% (from 6,046 to 37,922 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

This increase in YLDs can be attributed to an increase in the prevalence of leprosy as well as to the assignment of disability weights according to the age and sex distribution of grade 1 and grade 2 leprosy disabilities.

Firstly, prevalence estimates for leprosy increased by 99% (from 319,087 to 628,190 cases) from the GBD 2010 to the GBD 2013. In the GBD 2010, we relied on WHO prevalence data which represented cases under treatment. We assumed no excess mortality and assigned the value of the prior for duration in DisMod-MR to be 2 years. In the GBD 2013, we similarly assumed no excess mortality, however we considered the prevalence estimates to represent individuals that ever had leprosy, given that actual treatment duration is longer than 2 years.

Secondly, regarding disability weights, in the GBD 2010, we assigned all prevalent cases of leprosy a disability (grade 1 or 2) based on a super-region-specific proportion for disfigurement with itch (level 1) versus disfigurement with itch (level 2) that was the same for all years, ages, and sexes. We determined the fraction of leprosy cases with level 2 disability based on data on grade 2 disability (G2D) reported to the WHO, aggregated to the super-region level. We assigned all other cases a level 1 disability

In the GBD 2013, however, we calculated incidence of grade 1 and 2 disability (G1D and G2D) as a proportion of incident leprosy cases, based on the estimated incidence of leprosy, G2D proportions reported to the WHO (new G2D cases / all new leprosy cases, aggregated over sex and age), and the age and sex distribution of G1D and G2D among new leprosy cases (using data from Brazil).

We modeled the age and sex distribution of G1D and G2D jointly in a generalised ordinal logistic regression model which relaxed the proportional odds assumptions (i.e. we allowed that the proportions of G1D and G2D were not always proportional over different ages and sexes). For each country-year, we scaled the estimated age/sex distribution for G2D such that the overall G2D proportion equaled the reported proportion (taking into account uncertainty in the reported G2D proportion). To constrain the proportion e

25. Ischemic heart disease

YLD estimates for ischemic heart disease (IHD) decreased by 41% (from 8,770,304 to 5,190,172 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

This main reason for this decrease in YLDs is a 49% decrease in the prevalence of angina. In the GBD 2013, we altered our strategy such that all prevalence estimates from the World Health Survey Rose Angina Questionnaire were crosswalked downward towards more reliable non-WHS survey data. In the GBD 2010, we only performed this crosswalk for WHS surveys from sub-Saharan Africa. Therefore the lower prevalence fit was an intended outcome. A modern study in Helsinki used linked medical records and suggested that the Rose Angina Questionnaire significantly overestimates angina prevalence (Lallukka, Tea, Kristiina Manderbacka, Ilmo Keskimäki, Harry Hemingway, Ossi Rahkonen, Eero Lahelma, and Reunanen Antti. "Angina Pectoris: Relation of Epidemiological Survey to Registry Data." *European Journal of Cardiovascular Prevention & Rehabilitation* 18, no. 4 (August 1, 2011): 621–26. doi:10.1097/HJR.0b013e32833bfc73.).³² This study supports the lower angina prevalence estimates in the GBD 2013 as an improvement to the GBD 2010 results.

26. Hypertensive heart disease

YLD estimates for hypertensive heart disease increased by 124% (from 464,123 to 1,038,033 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

YLD for hypertensive heart disease come from the envelope of all heart failure. A big change in strategy between GBD 2010 and GBD 2013 was the use of age-specific hospital data instead of the age-standardised HF discharge data used in the GBD 2010. This led to lower rates in the young but higher rates in the elderly where most cases occur.

We calculated the prevalence of hypertensive heart failure by applying estimated proportion of heart failure due to hypertension and prevalence of heart failure. The aetiological fraction of hypertension in the GBD 2013 was higher than in the GBD 2010. For additional details, please refer to the description of methods for calculating the burden of heart failure on page 15.

27. Cardiomyopathy and myocarditis

YLD estimates for cardiomyopathy and myocarditis increased by 99% (from 395,345 to 780,880 YLDs) from the GBD 2010 to the GBD 2013 due to a 120% increase in the prevalence of heart failure due to cardiomyopathy. This change is significant.

A big change in the modelling strategy of heart failure between GBD 2010 and GBD 2013 was the use of age-specific hospital data instead of the age-standardised HF discharge data used in the GBD 2010. This led to lower rates in the young but higher rates in the elderly where most cases occur.

28. Atrial fibrillation and flutter

YLD estimates for atrial fibrillation and flutter decreased by 64% (from 2,428,072 to 881,463 YLDs) from the GBD 2010 to the GBD 2013 due to a 63% decrease in prevalence. This change is significant.

In the GBD 2013, we selected a different modelling strategy than in the GBD 2010. In the GBD 2010 prevalence in regions without data was informed by adding data on CSMR due to atrial fibrillation. We re-evaluated the CSMR data used in the GBD 2010 and find that it is implausibly low, in particular for East and South Asia. There was likely significant misclassification bias with CoD data for atrial fibrillation. In the GBD 2013, in addition to data on incidence, prevalence, and excess mortality, we used only INASDR due to atrial fibrillation as a covariate fixed effect. This informs regions without data in a way that reflects relative differences in atrial fibrillation death rates rather than their absolute magnitude.

29. Peripheral vascular disease

YLD estimates for peripheral vascular disease (PVD) decreased by 67% (from 419,514 to 128,972 YLDs) from the GBD 2010 to the GBD 2013 due to a significant decrease in estimated prevalence. This change is significant.

The model we used in the GBD 2010 had no age restriction for peripheral vascular disease whereas in the GBD 2013, we allowed prevalence to increase after age 30 as there were no data points at younger ages. This led to a prevalence estimate at ages 40-50 which was quite a bit lower than in the GBD 2010 and hence the large drop in prevalence. We think this is an improved model.

30. Endocarditis

YLD estimates for endocarditis decreased by 50% (from 61,668 to 30,923 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

This change can be attributed to a decrease in endocarditis prevalence resulting from the addition of new data to the GBD 2013 model, specifically new hospital data with lower admission rates of endocarditis.³³

31. Pneumoconiosis

YLD estimates for pneumoconiosis decreased by 87% (from 445,941 to 46,678 YLDs) from the GBD 2010 to the GBD 2013 due to changes to the modelling approach. This change is significant.

First, in the GBD 2013, for the coal workers pneumoconiosis and silicosis analyses, we dropped all data collected among occupational workers rather than attempting to crosswalk them to population-level data as we did in the GBD 2010. The GBD 2010 coal workers pneumoconiosis model estimated that data among coal workers was 22 times higher on average than population-level data. In the GBD 2013, however, we thought that correction to be implausibly low, thereby overestimating prevalence of this condition in countries where those data were present and in countries affected by those data. The GBD 2010 silicosis model estimated that data among miners was more than 400,000 times higher than population-level data. This could be plausible in some countries but is difficult to validate.

Second, in the GBD 2010 model, we did not use any country-level covariates; however, in the GBD 2013, we included the log of the age-standardised cause-specific death rate (ASDR) obtained from CODEm output as a country-level covariate on the prevalence of these diseases. ASDR was able to inform geographical variation in areas with little or no data.

Finally, in the GBD 2013, we imposed narrow bounds on the coefficient on sex to inform the split of aggregated data into sex-specific data points in an attempt to better capture the difference across sex. We estimated the male-to-female ratios from country-years of inpatient data and the ratios are shown in Appendix Table 19 below, alongside the sex ratios observed in cause of death results for comparison. The difference in male-to-female ratios between prevalence and mortality suggest at this aggregate level that mortality rates among males are higher than that among females for asbestosis, coal workers pneumoconiosis, and silicosis, and the opposite is suggested for other pneumoconiosis.

	Prevalence	Mortality
Asbestosis	5.5	7.1
Coal workers pneumoconiosis	3.3	8.5
Silicosis	8.2	13.0
Other pneumoconiosis	1.8	0.7

32. Interstitial lung disease and pulmonary sarcoidosis

YLD estimates for interstitial lung disease and pulmonary sarcoidosis increased by 53% (from 162,415 to 75,012 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

In the GBD 2010, the DisMod-MR tool used did not allow specification of individual parameters for country covariates so we applied the natural logarithm of the age-standardised death rate (LnASDR) for this cause to all epidemiological parameters. However, the updated DisMod-MR 2.0 tool used in the GBD 2013 allowed us to apply the LnASDR for this cause only to incidence as a country-level covariate to inform variation over space and time. Also in the GBD 2013, we included the estimated excess mortality rates obtained from an analysis of chronic obstructive pulmonary disease among countries with reliable prevalence and cause-specific mortality rate data to inform this model under the assumption that excess mortality rates are similar for the two causes. Finally, we included more data points of inpatient hospital data. Doing so caused the data adjustments to be slightly smaller for studies that reported only sarcoidosis cases, only idiopathic pulmonary fibrosis, or only both. GBD regions with the most drastic changes in prevalence in the GBD 2013, such as the South Asia region, lack data and were dependent on the country covariate on incidence and inclusion of excess mortality estimates from chronic obstructive pulmonary disease to better inform the disease compartmental model.

33. Peptic ulcer disease

YLD estimates for peptic ulcer disease (PUD) increased by 309% (from 311,428 to 1,244,936 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

Prevalence estimates for symptomatic peptic ulcer disease episodes increased by 105% (from 1.4 million to 2.8 million cases) from the GBD 2010 to the GBD 2013. In GBD 2013, we added data of symptomatic cases of PUD from surveys as well as outpatient and inpatient data; these surveys have much higher estimates than outpatient and inpatient data and used Norwegian data to adjust outpatient estimates for multiple visits of each patient. This led to the two-fold increase of the estimates of peptic ulcer episodes. However, the largest change in terms of YLD has come from the attribution of anemia to peptic ulcer disease. The higher estimate of peptic ulcer disease incidence has contributed to a higher fraction of anemia being attributed to this cause but another important reason is that the strategy changed to use incidence of underlying causes for anemia rather than prevalence to determine the fraction of total anemia by cause. As the duration for peptic ulcer disease is short relative to many other causes of anemia this would lead to a greater attribution.

34. Gastritis and duodenitis

YLD estimates for gastritis and duodenitis increased by 182% (from 855,406 to 2,340,849 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

Prevalence of episodes of gastritis and duodenitis increased marginally by 5.8% compared to the GBD 2010. In the GBD 2013, we used outpatient and inpatient data; for outpatient visits, we adjusted the number of cases based on Norway on multiple visits of each patient. The global results were close to the GBD 2010.

Additionally, the increase in YLDs for gastritis and duodenitis in the GBD 2013 can be attributed to a large increase in anemia due to a change in strategy to use incidence of underlying causes for anemia rather than prevalence (as we did in the GBD 2010) to determine the fraction of total anemia by cause. As the duration for gastritis and duodenitis is short relative to many other causes of anemia this led to a greater attribution.

35. Paralytic ileus and intestinal obstruction

YLD estimates for paralytic ileus and intestinal obstruction increased by 184% (from 12,586 to 32,506 YLDs) from the GBD 2010 to the GBD 2013 due to changes to covariates. This change is significant.

In the GBD 2013, we did not use *Health System Access* as a covariate.

In the previous version of DisMod-MR used in the GBD 2010, a very large negative coefficient (around -4) was estimated for health system access to model as a study level covariate. This led to significant, implausible, downward adjustment of incidence data from high income countries.

36. Inguinal, femoral, and abdominal hernia

YLD estimates for inguinal, femoral, and abdominal hernia decreased by 43% (from 441,373 to 252,738 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

In the GBD 2013, we scaled remission rates to reflect different waiting times for surgery by the health system access covariate. These changes increased the duration of the disease and therefore, also the prevalence calculated from incidence in low income countries and shortened the duration in high income countries compared to the GBD 2010 model. The net effect is that the lower prevalence in high and middle income countries was greater than the increase in low income countries and hence a lower prevalence in the GBD 2013. However, with wide uncertainty around these estimates this is not a significant change.

37. Gallbladder and biliary diseases

YLD estimates for gallbladder and biliary diseases increased by 34% (from 453,589 to 604,460 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

In the GBD 2013, we used more points of prevalence data from surveys on the prevalence of gallbladder and biliary diseases and outpatient data. We crosswalked the survey data to the outpatient data to have a more realistic estimate of symptomatic cases. These changes prompted an increase in the prevalence estimates in the GBD 2013 as compared to the GBD 2010.

38. Pancreatitis

YLD estimates for pancreatitis increased by 180% (from 206,140 to 570,179 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

In the GBD 2010, we ran models separately for men and women; however, in the GBD 2013, we did not run different models for each sex as DisMod-MR 2.0, the updated tool used in the GBD 2013 could better detect different patterns of age distribution for male and female than previous version of DisMod-MR used in the GBD 2010. This led to a sex distribution which is more compatible with input data. In the GBD 2010, we used *Health System Access* as a covariate and did not use a covariate to differentiate acute and chronic pancreatitis. *Health System Access* had a positive fixed effect on incidence and pushed the estimates to unrealistically low estimates in countries with low health system access. So, we did not use it in the recent round. Additionally, we used a study-level covariate, “acute vs. chronic,” to differentiate acute and chronic pancreatitis. As a result, these changes led to higher estimates of prevalence for pancreatitis in the GBD 2013.

39. Multiple sclerosis

YLD estimates for multiple sclerosis increased by 34% (from 525,528 to 703,495 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

We used significantly more data points (1,453 versus 968) in the GBD 2013 than in the GBD 2010. DisMod-MR 2.0 estimated a non-significant coefficient on the covariate for case ascertainment method (marking studies that did not have a confirmation of diagnosis by a physician or neurologist) while in the GBD 2010 those data points were adjusted downwards by 40%. A different value on the covariate for latitude contributed further to the 20% increase in prevalence estimates for the year 2010 between the two studies. A further contribution to higher YLD estimates was a change in strategy in determining severity distributions. In the GBD 2010 a separate meta-analysis was carried out for high income and low and middle income countries. As the confidence intervals for the proportions mild, moderate and severe were largely overlapping we decided to use globally pooled estimates for GBD 2013.

40. Idiopathic intellectual disability

YLD estimates for idiopathic intellectual disability increased by 348% (from 1,042,801 to 4,601,807 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

We increased data points from the GBD 2010 to the GBD 2013 (from 176 to 284) with better geographic coverage (from 25 to 30 countries). Relative risk was the main parameter that informed the mortality pattern for different age-groups in both GBD 2010 and GBD 2013. However, DisMod-MR estimates of relative risk in the GBD 2010 showed a plateau over a broad age range from 20 to 60 with values around 10 while the raw data had a peak of 10 at around age 20 and then sharply declined with age to close to one by age 60. The high relative risk values until age 60 resulted in a sharp decline of prevalence with virtually no cases left by age 60 and low prevalence overall. In the GBD 2013, the relative risk estimates followed the data neatly translating into a much higher prevalence at older age-groups and overall that seems more plausible.

41. Alcohol use disorders

YLD estimates for alcohol use disorders decreased by 45% (from 13,838,202 to 7,549,307 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

Prevalence estimates for alcohol use disorders decreased by 21% (from 96,456,983 to 75,796,379 cases) between the GBD 2010 and the GBD 2013 largely because DisMod-MR 2.0 produced an age pattern with a single peak at ages 20-40 rather than a peak at age 20 and another peak at age 45 as estimated in the GBD 2010 using the previous version of DisMod-MR. YLD estimates for alcohol use disorders decreased by a greater margin (45%) due to the inclusion of a milder health state (very mild alcohol dependence DW=0.123). There were small differences in the DWs for mild (0.235 in the GBD 2013 vs. 0.259 in the GBD 2010), moderate (0.373 vs. 0.388) and severe (0.570 vs. 0.549). Using the same survey data from NESARC and the Australian NSMHWB we get similar proportions asymptomatic (42% in the GBD 2013 vs. 44% in the GBD 2010), a large proportion in very mild (47% vs. not estimated), a much smaller proportion in mild (4% vs. 49%) and small proportions in the moderate (3% vs. 4%) and severe (4% vs. 2%) categories. The net effect is an average DW of 0.102 per prevalent case in the GBD 2013 (before comorbidity correction) as compared to 0.153 in the GBD 2010.

42. Cannabis use disorders

YLD estimates for cannabis use disorders decreased by 81% (from 2,058,989 to 394,871 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

As prevalence estimates for cannabis use disorders did not change significantly (a 4% increase from 13,091,176 to 13,577,895 cases), this decrease in YLDs can be attributed to changes to severity splits and disability weights. In the GBD 2010, we applied only one disability weight of 0.329 (0.233-0.455) to all symptomatic cases of cannabis use disorders. In the GBD 2013, however, we introduced a new “mild” disability weight of 0.039 (0.024-0.06) and then we split symptomatic cases between this mild disability weight and the original GBD 2010 disability weight, summarily renamed “moderate/severe” and updated to 0.266 (0.178-0.364) to reflect existing GBD 2010 data and additional data captured in new surveys conducted in four European countries). Severity splits also changed between the GBD 2010 and the GBD 2013 to accommodate this change. In the GBD 2010, we identified 51% of cases as

asymptomatic and 49% as symptomatic. In the GBD 2013, we identified 58% of cases as asymptomatic and 42% as symptomatic. Thirty-six percent of symptomatic cases were allocated to the mild category with the lower disability weight rather than to the moderate/severe category. These changes resulted in a lower YLD estimate for cannabis use disorders in the GBD 2013.

43. Acute glomerulonephritis

YLD estimates for acute glomerulonephritis increased by 149% (from 785 to 1,900 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

The prevalence increased by 45% but it was not a significant change. The increase is largely due to higher estimates for East and Southeast Asia, regions without any data. The estimates for the high income regions and Latin America for which there are data follow similar pattern as in the GBD 2010. The GBD 2013 estimates used the disability weight for moderate infectious disease (0.051). In the GBD 2010 the seemingly less appropriate disability weight for “generic disease without symptoms and worry” was used (0.029).

44. Chronic kidney disease

Chronic kidney disease due to diabetes mellitus

Chronic kidney disease due to hypertension

YLD estimates for chronic kidney disease increased from the GBD 2010 to the GBD 2013. Specifically, YLD estimates for chronic kidney disease due to diabetes mellitus increased by 121% (from 1,003,995 to 2,204,733 YLDs) and YLD estimates for chronic kidney disease due to hypertension increased by 185% (from 872,594 to 2,468,691 YLDs). These changes are significant.

Several factors contribute to the large increase in YLD for chronic kidney disease due to diabetes, hypertension and other causes (the latter in GBD2013 was split into an explicit category for glomerulonephritis and a smaller rest category of other chronic kidney disease). First, we used the log of the age-standardised mortality rate as a covariate in the model for CKD stages III, IV and V. This led to much greater differentials in disease occurrence than was estimated before where all regions closely followed the estimates for high income regions for which the vast majority of data were available. Second, in GBD2010, anemia was estimated for chronic kidney disease stage III only, assuming that the disability weights for stage IV and V incorporated the symptoms associated with anemia. In GBD2013 we made explicit estimates of anemia for stage IV. Third, we assumed a longer duration for survival (96-24 months) based on a systematic review of survival of stage V patients who do not receive dialysis or transplant (ref O'Connor J of Palliative Medicine 2011, 5:228). As these patients get a high disability weight for a longer duration this has caused quite an increase in YLDs.

45. Interstitial nephritis and urinary tract infections

YLD estimates for interstitial nephritis and urinary tract infections decreased by 73% (from 206,876 to 55,106 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

In the GBD 2013, we got access to Norway outpatient data to inform the data adjustment for inpatient hospital data to outpatient levels in addition to the data from the USA only used in the GBD 2010. Norway outpatient levels are much lower than USA rates resulting in a smaller upward data adjustment of hospital admission numbers than was used in the GBD 2010.

46. Benign prostatic hyperplasia

YLD estimates for benign prostatic hyperplasia decreased by 38% (from 5,094,065 to 3,156,254 YLDs) from the GBD 2010 to the GBD 2013 due to the addition of new data points. This change is not significant.

In the GBD 2010, estimates of benign prostatic hyperplasia relied on 184 survey data points from 21 countries; whereas in the GBD 2013, we added a substantial amount of hospital data from 68 sites (28 countries), bringing the total data points to 6828 from 78 sites (37 countries). We used study level covariates on inpatient and outpatient data to crosswalk between survey data. The increased number and improved geographic coverage of data points allowed

DisMod-MR 2.0 to account for wider and more accurate regional variations and resulted in lower prevalence estimates for regions which lacked data points in the GBD 2010.

47. Uterine fibroids

YLD estimates for uterine fibroids decreased by 31% (from 3,034,792 to 2,084,102 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

We added nine prevalence data points to this sparse data set that contained 26 incidence and 21 prevalence data points in the GBD 2010. The drop in prevalence estimates by 38% is partially due to lower prevalence of the new studies and partially due to differences in the covariate values estimated in DisMod-MR 2.0. Despite the scarcity of data four covariates had to be used to deal with variations in case definition and coefficient values varied between 2010 and 2013. YLDs dropped by a lesser proportion, 31%, due to a greater attribution of anemia envelope to fibroids.

48. Polycystic ovarian syndrome

YLD estimates for polycystic ovarian syndrome (PCOS) decreased by 59% (from 2,757,156 to 1,150,789 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

While prevalence estimates for PCOS decreased minimally (by 6%) between the GBD 2010 and the GBD 2013, YLD estimates decreased by a greater margin due to decreased disability weights for mild disfigurement (from 0.013 to 0.011) due to hirsutism and primary infertility (from 0.011 to 0.008).

49. Endometriosis

YLD estimates for endometriosis increased by 147% (from 555,576 to 1,334,574 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

The GBD 2010 data set contained just 28 data points for endometriosis. We added an additional 39 data points from the GBD 2013 systematic review. The coefficient for incidence data points without pathology confirmation decreased from 0.94 to 0.53 (in log space) and therefore these data points were adjusted upwards by a lesser amount. This resulted in a decrease in prevalence of 23%.

50. Genital prolapse

YLD estimates for genital prolapse decreased by 39% (from 1,809,270 to 1,045,092 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

Prevalence estimates for genital prolapse increased marginally by 4% between the GBD 2010 and GBD 2013. YLDs decreased by 39% as the new disability weight for stress incontinence (estimated to be present in 12.1% of cases) has lower value (0.02 vs. 0.142) than that for urinary incontinence that was used as a placeholder in the GBD 2010.

51. Hemoglobinopathies and hemolytic anemias

G6PD deficiency

YLD estimates for G6PD deficiency decreased by 76% (from 146,531 to 34,601 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

The modelling strategy for non-fatal health burden due to hemoglobinopathies was consistent from GBD 2010 to GBD 2013. Hemoglobinopathies are divided into four main causes: thalassemias, sickle cell disorders, glucose-6-phosphate dehydrogenase (G6PD) deficiency, and other hemoglobinopathies and hemolytic anemias. We modeled sub-types of each hemoglobinopathy separately. We estimated thalassemia burden in three separate models: 1) beta thalassemia major, 2) hemoglobin E-Beta thalassemia disease, and 3) hemoglobin H disease. We likewise estimated sickle cell burden in three separate models: 1) homozygous sickle cell and “severe” sickle cell-Beta thalassemia, 2) “mild” sickle cell-beta thalassemia, and 3) hemoglobin SC disease. We estimated the burden of glucose-6-phosphate dehydrogenase (G6PD) deficiency as a single model. Finally, we attributed a portion of the anemia not-otherwise-specified (NOS) burden, which was calculated in the analysis of the overall morbidity from anemia, to other hemoglobinopathies and hemolytic anemias.

Two important changes have occurred between GBD 2010 and GBD 2013. First, while we estimated anemia-related disability from heterozygotes, we did not report them separately. Second, while we estimated the disability associated with many different acute and chronic complications that can occur to those with hemoglobinopathies, we had not fully implemented a framework to ensure each of the health states is mutually exclusive and collectively exhaustive. As both of these details are, we believe, of great interest to clinicians and policymakers, they have been implemented for GBD 2013. Heterozygote frequencies, including the breakdown of which proportion of each are estimated to be symptomatic from anemia, are now explicitly reported. Those heterozygote states now included are the following: Beta-thalassemia trait, hemoglobin E trait, sickle cell trait, and hemizygous G6PD (a phenomenon to which only females are susceptible). Outcomes of homozygous and compound heterozygous disease states are now mutually exclusive and collectively exhaustive, which will improve the ease with which these figures can be interpreted at the country level.

We used the same specifications for DisMod-MR 2.0 models as we used in the GBD 2010. We constrained both remission and incidence to be zero. Case-fatality data used in models of non-fatal health outcomes again did not include the results of our mortality analysis based on the observation in many settings that all hemoglobinopathy-related mortality is not ascribed to it. With-condition mortality data from primary literature, as in the GBD 2010, thus was a primary informer of estimates of prevalence at older ages. Changes in DisMod-MR 2.0 from GBD 2010 were notable in the case of hemoglobinopathies, specifically in the ability for prevalence to be non-zero at birth. This change resulted in a modest increase in estimated initial number of cases for many of the hemoglobinopathies. The only significantly different result was for the thalassemias, which are known to all have high geographic heterogeneity, were estimated to be lower than previously in central and eastern Europe, a finding that is more in line with the primary data used in the models. To estimate carrier prevalence for thalassemias and sickle cell diseases—hemoglobin S, hemoglobin E, hemoglobin beta, and hemizygous G6PD (females only)—we assumed Hardy-Weinberg equilibrium.

We used the same method as previously to estimate the number of YLDs associated with each of the subtypes of hemoglobinopathies as guided by personal correspondence with Sir David Weatherall, an internationally-recognised hemoglobinopathologist, who completed an extensive literature review and country correspondence for GBD 2010. With the exception of anemia, only homozygous persons were considered to experience disability. The only disabling outcome associated with carrier status is anemia. Likewise, disability estimates for “other hemoglobinopathies and hemolytic anemias” was limited to that associated with anemia. Heart failure is an important non-fatal outcome of thalassemias and G6PD deficiency. To model the number of patients with heart failure attributable to each condition, we first estimated the total number of heart failure cases, then the aetiological fraction of heart failure cases that were due to thalassemias and G6PD deficiency. G6PD deficiency is otherwise considered to be asymptomatic for a vast majority of those with the condition (Class III-V). The only disability estimated, therefore, was that associated with anemia from chronic hemolysis (Class I) and hemolytic crises (Class II). Females heterozygous for G6PD deficiency exhibit chimerism, as one X chromosome becomes dominant in each of the red blood cells. We therefore estimated half as many heterozygous females will be symptomatic as homozygous females. YLDs due to thalassemias were estimated for anemia, heart failure, and infection individually. Six other sequelae—splenomegaly, skeletal deformity, delayed growth/puberty, diabetes, hypothyroidism, and leg ulcers—were combined into a single outcome called “other combined sequelae of thalassemia” as they are significant, but uncommon, with very little data to inform their frequency in populations. This functionally means that we estimate no persons with thalassemia are asymptomatic. Sickle cell-related YLDs were estimated in similar fashion—for anemia, heart failure, pain crises/splenic sequestration, stroke, and “other combined sequelae of sickle cell disorders,” though the proportion in each health state varied by subtype of sickle cell disorder.

52. Endocrine, metabolic, blood, and immune disorders

YLD estimates for endocrine, metabolic, blood, and immune disorders decreased by 32% (from 3,724,891 to 2,520,411 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

In the GBD 2010, endocrine, metabolic, blood and immune disorders included obesity which was no longer included under this sequela in the GBD 2013 as we consider it a risk factor, not a cause of disability per se. This resulted in a 32% decline in YLDs.

53. Osteoarthritis

YLD estimates for osteoarthritis (OA) decreased by 31% (from 17,148,545 to 11,856,790 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

This was caused by a decrease in prevalence due to revisions to incidence age patterns. In the GBD 2010, a zero incidence was assumed for the terminal age-group, which resulted in an age pattern where almost all incidence occurred around the age of 40-50 and then continued to decline till the terminal age-group of 100. This incidence pattern produced a sharp increase in prevalence around the age of 40) and resulted in an overestimation of prevalence at ages 40-60. In the GBD 2013, we assumed incidence has an increasing pattern with age. Although not as prominent a pattern as in knee OA, the hip OA model in the GBD 2010 also had an inconsistent incidence pattern with age that we revised in the GBD 2013. These corrections resulted in lower prevalence of osteoarthritis in the GBD 2013 estimates.

54. Gout

YLD estimates for gout increased by 53% (from 114,104 to 172,307 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

In the GBD 2013, we added new data sources with higher prevalence values (an increase from 607 to 684 data points) and, due to the inclusion of an additional study on the frequency of gout attacks, the proportion of time a patient is considered symptomatic by pooling average duration and number of attacks per year from literature increased from 7.2% to 9.4%.³⁴ These changes led to higher prevalence and YLD estimates for gout in the GBD 2013.

55. Congenital anomalies

Congenital heart anomalies

Cleft lip and cleft palate

Down syndrome

YLD estimates for congenital heart anomalies increased by 96% (from 563,703 to 1,136,663 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

YLD estimates for cleft lip and cleft palate decreased by 75% (from 254,288 to 64,883 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

YLD estimates for Down syndrome increased by 73% (from 627,314 to 1,073,994 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

The cause list for GBD 2013 included neural tube defects, cleft lip and palate, congenital heart disease, Down syndrome, Klinefelter syndrome, Turner syndrome, unbalanced and other chromosomal syndromes, and other congenital anomalies. Turner and Klinefelter syndrome were previously contained within the estimates for other chromosomal syndromes. As in the GBD 2010, we again subdivided congenital heart disease in the GBD 2013 into critical, severe, and less severe groups; we again modeled moderate and severe neural tube defects separately.

We modified several details of this estimation strategy in the GBD 2013, but generally maintained the same principles used in the GBD 2010 analysis. In the GBD 2010, in most cases, we assumed a constant baseline risk of congenital anomalies. In other words, in the absence of external influences, congenital conditions would arise at an identical rate everywhere for each condition. Estimation of birth prevalence for GBD 2010 involved adjusting the presumed constant risk for a number of proximate factors such as legality of abortion, maternal age, probability of stillbirth, and folic acid fortification. The specifics of adjustment were particular for each cause. We applied an additional uniform adjustment factor to those anomalies commonly associated with chromosomal abnormalities—congenital heart disease, neural tube defects, and cleft lip and palate—to exclude them from the non-chromosomal models. We then applied male-to-female ratios at the global level for neural tube defects and cleft lip and palate where sex differences have been consistently described. We then split final live birth prevalence into treated and untreated groups. We assumed treatment availability, and therefore live birth prevalence in each group, tracked with

the neonatal mortality rate (NMR). We converted data that described each condition's natural history as a function of treatment availability to standardised mortality ratios (SMR) based on the origin of each study.³⁵⁻⁴³ We then converted SMR data into excess mortality rates for each country, year, and age-group based on national mortality rates calculated from the GBD 2010 mortality analysis.⁴⁴ We paired these excess mortality rate data with treated and untreated live birth prevalence and modeled each group separately in DisMod-MR. We did not use study-level or country-level covariates in any of the models in the GBD 2010.

Our GBD 2013 estimation strategy involved five methodological updates. First, rather than *a priori* assuming constant risk, we analyzed primary data from all available congenital registries. We were able to identify 1,291 site-years of data from 48 countries and 31 of 33 provinces of China. Data came from the European Surveillance of Congenital Anomalies (EUROCAT), the International Clearinghouse for Birth Defects Monitoring System (ICBDMS), and the National Center of Birth Defects Monitoring of China which is run by the National Office of Maternal and Child Health Surveillance System (MCH). We extracted all data and entered it into a central database.

Second, our estimates focused on calculating live births, without additional quantification of numbers of stillbirths or terminations. We elected this approach largely because there is substantial variation in reported rates of termination, even when controlling for its legality, as well as in reliability of stillbirth reporting. We applied male-to-female ratios to the primary data for neural tube defects and cleft lip and palate and we calculated live birth prevalence for each dataset entry as the number of live births divided by the total number of births in that entry.

Third, we analyzed the primary data to inform the proportion of anomalies associated with chromosomal abnormalities. EUROCAT presents isolated *and* chromosomally-associated anomaly counts, so we extracted both and identified the latter with a binary study-level covariate. We then carefully reviewed underlying documentation of all other sources and likewise identified each datum using the same binary covariate. Study-level covariates function like empirical correction factors, identifying systematic differences between types of data (e.g. different diagnostic criteria or sample populations) to facilitate quantitative cross-walking by DisMod-MR 2.0. We included an additional study-level covariate for all congenital models to identify those data where live births and stillbirths were aggregated in the numerator.

Fourth, we estimated birth prevalence for each condition using DisMod-MR 2.0. We combined the study-covariates above with country-level covariates (from the GBD Covariates Database) that corresponded to proximate factors affecting live birth prevalence. Many were the same as used in the GBD 2010 (e.g. legality of abortion and maternal age), but others were different. For example, instead of folic acid fortification for neural tube defects and cleft lip and palate, our analysis of the compiled primary data suggested the logit-transformed *Percent of total calories consumed as vegetables* covariate was a better predictor of live birth prevalence. Using this approach we were also able to fully integrate the GBD 2013 specific cause-of-death results by including natural log-transformed age-standardised mortality rates as country-level covariates.⁴⁵

Finally, in the GBD 2013, we paired the birth prevalence results above with country, age, sex, and year-specific excess mortality rates to estimate prevalence in all age groups using DisMod-MR 2.0. We utilised the same assumptions about treatment access—including its relationship to national NMR—as were employed in the GBD 2010. As before, we generated excess mortality rate data for each country, age-group, sex and year from pooled SMR data. DisMod-MR 2.0 thus estimated age-specific prevalence as a single model for each condition.

Our approach to calculating the disability associated with each of the congenital conditions was largely unchanged in the GBD 2013. From a UK study, 70% (95% UI 61.6-78.4%) of those with neural tube defects were considered to have severe mobility impairment, often with urinary incontinence, while the remainder was continent and had more moderate mobility impairment.⁴⁶ The disability weight (DW) for moderate motor impairment in the GBD 2013 was 0.061 which is somewhat lower than the GBD 2010 when it was 0.076; for severe motor impairment the GBD 2013 DW was 0.402, a slightly higher value than the 0.377 used in the GBD 2010; the DW for incontinence was relatively unchanged at 0.139.

For congenital heart disease, a UK-based cross-sectional short form (36) functional health survey analyzed cohort physical and mental functional limitations, which we converted to a corresponding DW using the same functional

form as described in our severity analysis.^{47,48} We assumed this DW to be experienced by 100% of those surviving with critical and severe congenital heart disease, and 55% of those with less severe congenital heart defects. We based this latter proportion on observation that nearly 75% of those in this category do not require an operation⁴⁹ and at least 60% of those are asymptomatic.^{50,51} We estimated the subset of those with mild, moderate, or severe heart failure due to congenital heart disease separately as part of the overall GBD 2013 heart failure analysis.

As in the GBD 2010, we assumed disability associated with cleft lip and palate to be dependent on the level of care available in a given country-year. We calculated the proportion of the population in each of three tiers—modern care including surgery and supportive care, basic surgery, and no care—using national NMR in the same way that SMR were interpolated for prevalence models. This led to different proportions between the three tiers compared to the GBD 2010 which used Smiletrain data to estimate access to surgical corrections in a range of low and middle income countries (including China, Pakistan, Bangladesh, Philippines, India, and Ethiopia) and assumed that all surgery in low and middle income countries was ‘basic’. We estimated unoperated clefts to be universally associated with moderate disfigurement and speech problems. The GBD 2013 DW were 0.067 for moderate disfigurement and 0.051 for speech problems, both of which are slightly lower than the GBD 2010 values of 0.072 and 0.054, respectively. As in the GBD 2010, we estimated that 15% of those with access to modern care would have residual disability with two thirds having mild disfigurement, two thirds with speech problems, and the remainder with moderate disfigurement.⁵²⁻⁵⁴ We estimated the proportion with disability to be twice as high in those with access to only basic surgery. We assumed all successfully repaired clefts to have no disability.

We combined the category of other chromosomal syndromes with that of unbalanced chromosomal arrangements (defined by ICD-10 codes Q90-99 except Down, Klinefelter, and Turner syndromes) and renamed it “unbalanced and other chromosomal syndromes”. This is the reason for the increased burden estimates. Like in the GBD 2010, we again estimated disability to be of similar nature in each of Down syndrome and unbalanced and other chromosomal disorders. We estimated disability associated with a combined 95% probability of intellectual disability,⁵⁵ 42% likelihood of congenital heart disease⁵⁶ most of which are severe⁵⁷ and/or warrant early intervention, and early-onset dementia⁵⁸ ranging from 8% in 45-49 year-olds up to 75% in those 55 years and older. We estimated that 100% of adult males with Klinefelter syndrome would be infertile and a subset have borderline or mild intellectual disability in all age groups.⁵⁹ We likewise assumed Turner syndrome to be associated with universal primary infertility in adult females and congenital heart disease in a subset at all ages.⁶⁰ DWs for all tiers of intellectual disability were at least 25% higher in the GBD 2013 than previously. Those for moderate and severe dementia were also somewhat higher, while that for infertility was slightly lower. On aggregate, DW changes conferred a moderate increase in estimated severity of chromosomal syndromes.

56. Psoriasis

YLD estimates for psoriasis increased by 332% (from 1,050,679 to 4,519,006 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

Psoriasis prevalence increased by 184% between the GBD 2010 and the GBD 2013. In the GBD 2013, the psoriasis epidemiological dataset approximately doubled in size from the GBD 2010 as we added data from an additional 30 prevalence studies and 5 incidence studies and these tended to be higher than data points used in the GBD 2010. This was also the case for other regions. Additionally, we modelled psoriasis with a longer duration in the GBD 2013 than in the GBD 2010. A comparison of incidence and prevalence data points (e.g. from the USA and UK) showed between an 8- to 10-fold difference in level of incidence from that of prevalence in the same country, suggesting a more chronic disease pattern, and a long duration. Based on this and consultations with experts, in the GBD 2013 we modelled psoriasis with remission set between 0.05 and 0.15 as opposed to the GBD 2010 remission assumption varying between 1 and 4 which translates to an average duration of less than one year.

YLDs for psoriasis increased by a greater proportion than prevalence as we did not use a proportion of cases without symptoms as was done in the GBD 2010, arguing that most data come from surveys that include examination and therefore picks up cases who are symptomatic only. The disability weights and the severity distribution changed marginally only.

57. Cellulitis

YLD estimates for cellulitis decreased by 68% (from 378,097 to 114,741 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

Cellulitis prevalence decreased by 84% between the GBD 2010 and the GBD 2013. The GBD 2010 dataset included 36 data points from the MEPS dataset, 12 data points from a published survey of cellulitis in a US sample,⁶¹ and 4,590 data points from a combination of both in-patient and out-patient cases. The GBD 2013 literature update expanded considerably on data sources, culminating in a dataset made up of the same MEPS and survey data points but 13,191 data points from in-patient samples or in-patient and out-patient samples. We modelled MEPS data points as prevalence in the GBD 2010 but experts advised that the survey's sampling methodology was more likely to capture estimates equivalent to the incidence of cellulitis, meaning that in the GBD 2013 model we did not use any prevalence data points. In both the GBD 2010 and the GBD 2013, we used a study-level covariate to adjust incidence data points derived from in-patient samples upwards towards data points derived from in-patient and out-patient samples combined which were more representative of the general population. Due to additional data, this covariate had a lower coefficient in the GBD 2010 (-3.1) compared to the GBD 2013 (-2.7) translating into 50% lower crosswalk in the GBD 2013. The average disability weight per case increased from 0.035 to 0.071 as we no longer make an assumption that there is a proportion asymptomatic.

58. Pyoderma

YLD estimates for pyoderma decreased by 98% (from 1,322,170 to 32,759 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

In the GBD 2013, we estimated only a small fraction of the prevalence of impetigo, abscesses and other bacterial skin conditions estimated in the GBD 2010. This large difference was due to a change in assumptions on remission. For impetigo in the GBD 2010, remission was defined as "bound between 1 and 13 treated cases per patient-year (which corresponds to a duration between 4 weeks and 1 year)" allowing DisMod-MR to make estimates close to 1 corresponding to an average duration of almost one year. In the GBD 2013, however, we consulted with experts who agreed that duration should be much shorter: between 2 (treated) to 4 (untreated) weeks. This significant change in duration produced substantially lower prevalence in the GBD 2013 estimates.

59. Fungal skin diseases

YLD estimates for fungal skin diseases increased by 70% (from 2,309,877 to 3,692,288 YLDs) between the GBD 2010 and the GBD 2013. This change is not significant.

Prevalence estimates for fungal skin diseases decreased by 34% from the GBD 2010 to the GBD 2013. In the GBD 2010, we estimated prevalence for all fungal skin diseases combined; however, in the GBD 2013, we estimated prevalence separately for tinea capitis and a combined group of 'any' other fungal skin disease. Although this makes it difficult to directly compare prevalence output between the GBD 2010 and the GBD 2013 for fungal skin diseases, some differences in covariates used may explain the decrease in prevalence. In the GBD 2013, a study-level covariate was included in the "any other fungal skin disease" model to adjust data points derived from MEPS towards the level of other prevalence data points. As MEPS is aimed at collecting data on health expenditure, its sampling strategy is biased towards those seeking health care which only represents part of the distribution of fungal skin diseases in the population. This covariate had a smaller upwards adjustment by a factor 5.6 than the equivalent MEPS covariate used in the GBD 2010 for the all fungal skin diseases model (a factor 8.5). In the GBD 2010 model, also a mean temperature country level covariate was used which had a statistically significant effect on prevalence (1.25, 1.02-1.55) but due to changes in the dataset, this covariate effect was not statistically significant in the GBD 2013. YLDs, however, increased by 70% because in the GBD 2013 we did not take into account a proportion of asymptomatic cases as we did in the GBD 2010, given that data are from surveys with examination of skin problems and therefore, by definition, are symptomatic. This led to an average disability weight per case that was 2.4 times higher than in the GBD 2010 (0.0056 vs 0.0023).

60. Viral skin diseases

YLD estimates for viral skin diseases increased by 42% (from 2,777,357 to 3,869,719 million YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

Viral skin diseases prevalence decreased by 40% between the GBD 2010 and the GBD 2013. We modelled prevalence separately for viral warts and molluscum contagiosum and the majority of the decrease in prevalence between the GBD 2010 and the GBD 2013 can be explained by changes related to molluscum contagiosum. A re-evaluation of the GBD 2010 data points for inclusion in the GBD 2013 showed that the wrong parameter unit had been captured for a number of incidence data points in the GBD 2010 dataset causing them to be ten times higher in the dataset than what was reported in the study.⁶² This artificially inflated the incidence (and therefore prevalence) of molluscum contagiosum in the GBD 2010. In the GBD 2010, a country-level covariate was used which made use of levels of sanitation between countries to improve the predictive power of the model. This covariate had an upward adjustment of 0.32 (0.23-0.43) on incidence. The association between sanitation and the incidence of molluscum contagiosum is not entirely defined and when tested in the GBD 2013 this covariate derived levels and global variations in prevalence that were inconsistent to available data points. As a result, we did not include the covariate in the final GBD 2013 model. YLD estimates for viral skin diseases increased by 42% between the GBD 2010 and the GBD 2013 because we did not take into account a proportion of asymptomatic cases as we did in the GBD 2010, given that data were from surveys with examination of skin problems and therefore, by definition, are symptomatic. This led to an average disability weight per case of 0.031 compared to 0.013 in the GBD 2010.

61. Acne vulgaris

YLD estimates for acne vulgaris increased by 81% (from 4,011,597 to 7,260,747 YLDs) between the GBD 2010 and the GBD 2013. This change is not significant.

Prevalence estimates for acne vulgaris showed little change (an increase of 3%) between the GBD 2010 and the GBD 2013. YLDs increased by 81% between the GBD 2010 and the GBD 2013 because we did not take into account a proportion of asymptomatic cases, given that most data points are from examination surveys and hence finding symptomatic cases. This led to an average disability weight per case of 0.011 compared to 0.006 in the GBD 2010.

62. Alopecia areata

YLD estimates for alopecia areata decreased by 78% (from 1,332,849 to 277,109 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

Prevalence estimates for alopecia areata decreased by 78% (from 38,337,044 to 83,113,737 cases) between the GBD 2010 and the GBD 2013. In contrast to the GBD 2010, in the GBD 2013, we used lower estimates from the outpatient data for the USA.^{63,64} As the largest source of data, this led to a different age pattern and overall level of estimation. YLDs also decreased concomitantly by 78% between the GBD 2010 and the GBD 2013 as the severity distribution and disability weights did not change.

63. Pruritus

YLD estimates for pruritus decreased by 99% (from 2,108,655 to 10,434 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

In the GBD 2013, we estimated just under one million cases of pruritus, a small fraction of the 280 million estimated in the GBD 2010. In the GBD 2010, studies of ‘itch’ were used as prevalence of pruritus and thus included cases of itchy skin and non-skin conditions for which separate estimates are being made. Restricting data to outpatient data from Norway and the USA and a few data points from the literature of people diagnosed with pruritus (i.e. excluding known causes of itch) in general practice produced much lower, but more plausible, prevalence, and therefore, YLD estimates.

64. Urticaria

YLD estimates for urticaria increased by 69% (from 2,586,597 to 4,320,516 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

This change can be attributed to our decision not to include a proportion asymptomatic in the GBD 2013 as we did in the GBD 2010, given that most data points were from examination surveys and hence finding symptomatic cases. This led to an average disability weight per case of 0.059 compared to 0.031 in the GBD 2010.

65. Decubitus ulcer

YLD estimates for decubitus ulcer decreased by 48% (from 479,638 to 246,583 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

Prevalence estimates for decubitus ulcer decreased by 61% between the GBD 2010 and the GBD 2013, largely due to a change in the remission assumption. In the GBD 2010, bounds on remission were set between 0 and 12. The estimates of remission were quite a bit smaller than one, particularly at older ages which led to implausible implied durations ranging from 1 to almost 20 years. This meant that we overestimated the prevalence estimated from the incidence data points. In the GBD 2013, however, we set bounds on remission (0.5 to 6) but estimates were between 4 and 5, corresponding to more realistic duration of around 3 months. YLDs decreased by a smaller proportion than prevalence as the average disability weight per case across three levels of severity increased from 0.108 to 0.146.

66. Cataract

YLD estimates for cataract decreased by 43% (from 4,737,827 to 2,747,365 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

For details regarding cataract modelling changes, please refer to the description of methods for calculating the burden of vision impairment on page 21.

67. Macular degeneration

YLD estimates for macular degeneration decreased by 52% (from 1,331,841 to 647,065 YLDs) from the GBD 2010 to the GBD 2013. This change is significant.

For details regarding macular degeneration modelling changes, please refer to the description of methods for calculating the burden of vision impairment on page 21.

68. Periodontal diseases

YLD estimates for periodontal diseases decreased by 43% (from 5,412,999 to 3,060,236 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

In the GBD 2013, severe chronic periodontitis (SCP) was also estimated using the same framework as the GBD 2010.⁶⁵ We included three definitions of SCP commonly found in the updated systematic literature review: 1) Community Periodontal Index of Treatment Needs (CPITN) - Class 4 only, 2) Clinical Attachment Loss (AL) > 6mm, and 3) Gingival Pocket Depth (PD) > 5mm. If more than one type of data was included in a study, our first preference was AL followed by PD, with CPITN considered the least accurate representation of the GBD case definition. The purpose of taking this approach rather than crosswalking the data in DisMod-MR 2.0 is that the relationships between the three values are not constant with respect to age and potentially vary by gender. Indeed, the age variability is likely part of the reason that multiple definition of SCP have been developed. Naturally, all the input data for SCP and permanent caries excludes those in the population that have already lost all their teeth. So, while 100% of those with periodontal disease are symptomatic, the parent model needs to have the denominator reduced because the input data already excludes those that are edentulous. In the GBD 2010, we only had the capability of subtracting the edentulism rate for each super-region (average for 1990 and 2010) from the predicted prevalence of SCP, but for this analysis have corrected for edentulism in each country, age-group, sex, and year independently. The net result of this is a drop in prevalence by 37%. The slightly higher drop in YLDs is due to a small change downwards in the value of the disability weight from 0.008 to 0.007.

69. Edentulism and severe tooth loss

YLD estimates for edentulism and severe tooth loss increased by 39% (from 4,668,474 to 6,429,342 YLDs) from the GBD 2010 to the GBD 2013. This change is not significant.

Prevalence of edentulism and severe tooth loss increased by 49%. Quantitatively, most changes in the levels and trends of edentulism can be traced back to two small changes in the estimation strategy. First, we eliminated the country-covariate for year. The effect of this covariate is to project the same temporal pattern—*increase or decrease*—to every location. However, with the addition of additional prevalence data, there emerged some geographic heterogeneity in time trends so we eliminated the covariate. While DisMod-MR 2.0 still did predict time

trends, these trends were limited to a subset of locations where it is supported by data. Second, after further review we elected to exclude the only prevalence data available from >65 year olds in sub-Saharan Africa. In addition to having lower prevalence than any other study in this age group by nearly an order of magnitude, this lone study was strongly influencing model predictions. As a result of this exclusion, edentulism prevalence estimates for sub-Saharan Africa are still among the lowest in the world, but are nearly twice the GBD 2010 estimate. Symptomatic toothlessness leads to “great difficulty in eating meat, fruits, and vegetables”. As in the GBD 2010, the global proportion of those with symptoms was determined via pooled analysis and estimated to be 0.444 (0.438 – 0.451).⁶⁶⁻⁶⁸

Supplemental Appendix Materials and Detailed Results for Non-fatal Health Outcomes

- Appendix Table A.1 – GBD 2013 cause and sequelae list
- Appendix Table A.2 – List of International Classification of Diseases codes mapped to the Global Burden of Disease cause list for causes of disability
- Appendix Table A.3 – Citation list by country
- Appendix Table A.4 – Model type and fit metrics: R-squared
- Appendix Table A.5 – ICD 9-CM mapped to MEPS data by GBD 2013 cause list
- Appendix Table A.6 – Disability weight lay descriptions
- Appendix Table A.7 – Sequelae severity distribution descriptions
- Appendix Figure B.1 – GBD 2010 DisMod 1.0 Cascade
- Appendix Figure B.2 – GBD 2013 DisMod-MR 2.0 Cascade
- Appendix Table B.1 – DisMod-MR 2.0 statistical output by cause
- Appendix Table G.1 – Sequelae-level prevalence results
- Appendix Table G.2 – Sequelae-level YLDs results
- Appendix Table G.3 – Age-specific global results – YLDs and prevalence (cause-level)
- Appendix Table G.4 – Country-specific, all age results – YLDs and prevalence (cause-level)

Mild hearing loss with ringing due to H influenzae type B meningitis	5
Moderate hearing loss due to H influenzae type B meningitis	5
Moderate hearing loss with ringing due to H influenzae type B meningitis	5
Moderately severe hearing loss due to H influenzae type B meningitis	5
Moderately severe hearing loss with ringing due to H influenzae type B meningitis	5
Severe hearing loss due to H influenzae type B meningitis	5
Severe hearing loss with ringing due to H influenzae type B meningitis	5
Profound hearing loss due to H influenzae type B meningitis	5
Profound hearing loss with ringing due to H influenzae type B meningitis	5
Complete hearing loss due to H influenzae type B meningitis	5
Complete hearing loss with ringing due to H influenzae type B meningitis	5
Meningococcal meningitis	4
Acute meningococcal meningitis	5
Mild behavioral problems due to meningococcal meningitis	5
Mild motor impairment due to long term due to meningococcal meningitis	5
Mild motor plus cognitive impairments due to meningococcal meningitis	5
Borderline intellectual disability due to meningococcal meningitis	5

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Monocular distance vision loss due to meningococcal meningitis	5
Mild intellectual disability due to meningococcal meningitis	5
Moderate motor impairment due to meningococcal meningitis	5
Severe motor impairment due to meningococcal meningitis	5
Moderate motor plus cognitive impairments due to meningococcal meningitis	5
Severe motor plus cognitive impairments due to meningococcal meningitis	5
Epilepsy due to meningococcal meningitis	5
Blindness due to meningococcal meningitis	5
Mild hearing loss due to meningococcal meningitis	5
Mild hearing loss with ringing due to meningococcal meningitis	5
Moderate hearing loss due to meningococcal meningitis	5
Moderate hearing loss with ringing due to meningococcal meningitis	5
Moderately severe hearing loss due to meningococcal meningitis	5
Moderately severe hearing loss with ringing due to meningococcal meningitis	5
Severe hearing loss due to meningococcal meningitis	5
Severe hearing loss with ringing due to meningococcal meningitis	5
Profound hearing loss due to meningococcal meningitis	5
Profound hearing loss with ringing due to meningococcal meningitis	5
Complete hearing loss due to meningococcal meningitis	5
Complete hearing loss with ringing due to meningococcal meningitis	5
Other meningitis	4
Acute viral meningitis	5
Other acute bacterial meningitis	5
Mild behavioral problems due to other bacterial meningitis	5
Mild motor impairment due to long term due to other bacterial meningitis	5
Mild motor plus cognitive impairments due to other bacterial meningitis	5
Borderline intellectual disability due to other bacterial meningitis	5
Monocular distance vision loss due to other bacterial meningitis	5
Mild intellectual disability due to other bacterial meningitis	5
Moderate motor impairment due to other bacterial meningitis	5
Severe motor impairment due to other bacterial meningitis	5
Moderate motor plus cognitive impairments due to other bacterial meningitis	5
Severe motor plus cognitive impairments due to other bacterial meningitis	5
Epilepsy due to other meningitis	5
Blindness due to other bacterial meningitis	5
Mild hearing loss due to other bacterial meningitis	5
Mild hearing loss due with ringing to other bacterial meningitis	5
Moderate hearing loss due to other bacterial meningitis	5
Moderate hearing loss with ringing due to other bacterial meningitis	5
Moderately severe hearing loss due to other bacterial meningitis	5
Moderately severe hearing loss with ringing due to other bacterial meningitis	5
Severe hearing loss due to other bacterial meningitis	5
Severe hearing loss with ringing due to other bacterial meningitis	5
Profound hearing loss due to other bacterial meningitis	5
Profound hearing loss with ringing due to other bacterial meningitis	5
Complete hearing loss due to other bacterial meningitis	5
Complete hearing loss with ringing due to other bacterial meningitis	5
Encephalitis	3
Acute encephalitis	4
Mild behavioral problems due to encephalitis	4
Mild motor impairment due to long term due to encephalitis	4
Mild motor plus cognitive impairments due to encephalitis	4
Borderline intellectual disability due to encephalitis	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Monocular distance vision loss due to encephalitis	4
Mild intellectual disability due to encephalitis	4
Moderate motor impairment due to encephalitis	4
Severe motor impairment due to encephalitis	4
Moderate motor plus cognitive impairments due to encephalitis	4
Severe motor plus cognitive impairments due to encephalitis	4
Epilepsy due to encephalitis	4
Blindness due to encephalitis	4
Diphtheria	3
Moderate diphtheria	4
Severe diphtheria	4
Whooping cough	3
Tetanus	3
Severe tetanus	4
Mild motor impairment due to neonatal tetanus	4
Mild motor plus cognitive impairments due to neonatal tetanus	4
Moderate motor impairment due to neonatal tetanus	4
Moderate motor impairment with blindness due to neonatal tetanus	4
Moderate motor impairment with epilepsy due to neonatal tetanus	4
Moderate motor impairment with blindness and epilepsy due to neonatal tetanus	4
Moderate motor plus cognitive impairment with blindness due to neonatal tetanus	4
Moderate motor plus cognitive impairment with epilepsy due to neonatal tetanus	4
Moderate motor plus cognitive impairment with blindness and epilepsy due to neonatal tetanus	4
Severe motor impairment due to neonatal tetanus	4
Severe motor impairment with blindness due to neonatal tetanus	4
Severe motor impairment with epilepsy due to neonatal tetanus	4
Severe motor impairment with blindness and epilepsy due to neonatal tetanus	4
Severe motor plus cognitive impairment with blindness due to neonatal tetanus	4
Severe motor plus cognitive impairment with epilepsy due to neonatal tetanus	4
Severe motor plus cognitive impairment with blindness and epilepsy due to neonatal tetanus	4
Measles	3
Moderate measles	4
Severe measles	4
Varicella and herpes zoster	3
Chickenpox	4
Herpes zoster	4
Neglected tropical diseases and malaria	2
Malaria	3
Asymptomatic malaria parasitemia (PfPR)	4
Mild malaria	4
Moderate malaria	4
Severe malaria	4
Moderate motor impairment due to malaria	4
Moderate motor impairment with blindness due to malaria	4
Moderate motor impairment with epilepsy due to malaria	4
Moderate motor impairment with blindness and epilepsy due to malaria	4
Moderate motor plus cognitive impairment with blindness due to malaria	4
Moderate motor plus cognitive impairment with epilepsy due to malaria	4
Moderate motor plus cognitive impairment with blindness and epilepsy due to malaria	4
Severe motor impairment due to malaria	4
Severe motor impairment with blindness due to malaria	4
Severe motor impairment with epilepsy due to malaria	4
Severe motor impairment with blindness and epilepsy due to malaria	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Severe motor plus cognitive impairment with blindness due to malaria	4
Severe motor plus cognitive impairment with epilepsy due to malaria	4
Severe motor plus cognitive impairment with blindness and epilepsy due to malaria	4
Mild anemia due to malaria parasitemia (PfPR)	4
Moderate anemia due to malaria parasitemia (PfPR)	4
Severe anemia due to malaria parasitemia (PfPR)	4
Chagas disease	3
Acute Chagas disease	4
Mild chronic digestive disease due to Chagas disease	4
Moderate chronic digestive disease due to Chagas disease	4
Asymptomatic Chagas disease	4
Atrial fibrillation and flutter due to Chagas disease	4
Mild heart failure due to Chagas disease	4
Moderate heart failure due to Chagas disease	4
Severe heart failure due to Chagas disease	4
Leishmaniasis	3
Visceral leishmaniasis	4
Moderate visceral leishmaniasis	5
Severe visceral leishmaniasis	5
Cutaneous and mucocutaneous leishmaniasis	4
African trypanosomiasis	3
Disfigurement due to African trypanosomiasis	4
Severe motor plus cognitive impairments due to African trypanosomiasis	4
Schistosomiasis	3
Mild schistosomiasis	4
Mild diarrhea due to schistosomiasis	4
Hematemesis due to schistosomiasis	4
Hepatomegaly due to schistosomiasis	4
Ascites due to schistosomiasis	4
Dysuria due to schistosomiasis	4
Bladder pathology due to schistosomiasis	4
Hydronephrosis due to schistosomiasis	4
Mild anemia due to schistosomiasis	4
Moderate anemia due to schistosomiasis	4
Severe anemia due to schistosomiasis	4
Cysticercosis	3
Cystic echinococcosis	3
Abdominal problems due to cystic echinococcosis	4
Chronic respiratory disease due to cystic echinococcosis	4
Epilepsy due to echinococcosis	4
Lymphatic filariasis	3
Prevalence of detectable microfilaria due to lymphatic filariasis	4
Lymphedema due to lymphatic filariasis	4
Hydrocele due to lymphatic filariasis	4
Onchocerciasis	3
Asymptomatic onchocerciasis	4
Mild skin disease due to onchocerciasis	4
Mild skin disease without itch due to onchocerciasis	4
Moderate skin disease due to onchocerciasis	4
Severe skin disease due to onchocerciasis	4
Severe skin disease without itch due to onchocerciasis	4
Moderate vision impairment due to onchocerciasis	4
Severe vision impairment due to onchocerciasis	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Blindness due to onchocerciasis	4
Trachoma	3
Moderate vision impairment due to trachoma	4
Severe vision impairment due to trachoma	4
Blindness due to trachoma	4
Dengue	3
Moderate dengue	4
Severe dengue	4
Post-dengue chronic fatigue syndrome	4
Yellow fever	3
Asymptomatic yellow fever	4
Moderate yellow fever	4
Severe yellow fever	4
Rabies	3
Intestinal nematode infections	3
Ascariasis	4
Heavy infestation of ascariasis	5
Mild abdominopelvic problems due to ascariasis	5
Severe wasting due to ascariasis	5
Asymptomatic ascariasis	5
Trichuriasis	4
Heavy infestation of trichuriasis	5
Mild abdominopelvic problems due to trichuriasis	5
Severe wasting due to trichuriasis	5
Asymptomatic trichuriasis	5
Hookworm disease	4
Heavy infestation of hookworm	5
Mild abdominopelvic problems due to hookworm disease	5
Severe wasting due to hookworm disease	5
Mild anemia due to hookworm disease	5
Moderate anemia due to hookworm disease	5
Severe anemia due to hookworm disease	5
Asymptomatic hookworm disease	5
Food-borne trematodiasis	3
Asymptomatic clonorchiasis	4
Asymptomatic fascioliasis	4
Asymptomatic intestinal fluke infection	4
Asymptomatic opisthorchiasis	4
Asymptomatic paragonimiasis	4
Heavy opisthorchiasis due to food-borne trematodiasis	4
Heavy clonorchiasis due to food-borne trematodiasis	4
Heavy intestinal fluke infection due to food-borne trematodiasis	4
Heavy fascioliasis due to food-borne trematodiasis	4
Heavy paragonimiasis due to food-borne trematodiasis	4
Cerebral paragonimiasis	4
Other neglected tropical diseases	3
Acute infection due to other neglected tropical diseases	4
Mild anemia due to other neglected tropical diseases	4
Moderate anemia due to other neglected tropical diseases	4
Severe anemia due to other neglected tropical diseases	4
Maternal disorders	2
Maternal hemorrhage	3
Maternal hemorrhage (< 1L blood lost)	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Maternal hemorrhage (> 1L blood lost)	4
Mild anemia due to maternal hemorrhage	4
Moderate anemia due to maternal hemorrhage	4
Severe anemia due to maternal hemorrhage	4
Maternal sepsis and other maternal infections	3
Puerperal sepsis	4
Other maternal infections	4
Infertility due to puerperal sepsis	4
Maternal hypertensive disorders	3
Other hypertensive disorders of pregnancy	4
Severe pre-eclampsia	4
Long term sequelae of severe pre-eclampsia	4
Eclampsia	4
Long term sequelae of eclampsia	4
Obstructed labor	3
Obstructed labor, acute event	4
Rectovaginal fistula	4
Vesicovaginal fistula	4
Complications of abortion	3
Other maternal disorders	3
Neonatal disorders	2
Preterm birth complications	3
Asymptomatic retinopathy of prematurity	4
Mild vision impairment due to retinopathy of prematurity	4
Moderate vision impairment due to retinopathy of prematurity	4
Severe vision impairment due to retinopathy of prematurity	4
Blindness due to retinopathy of prematurity	4
Mild motor impairment due to neonatal preterm birth complications <28wks	4
Mild motor plus cognitive impairments due to neonatal preterm birth complications <28wks	4
Mild motor impairment due to neonatal preterm birth complications 28-32wks	4
Mild motor plus cognitive impairments due to neonatal preterm birth complications 28-32wks	4
Mild motor impairment due to neonatal preterm birth complications 32-36wks	4
Mild motor plus cognitive impairments due to neonatal preterm birth complications 32-36wks	4
Moderate motor impairment due to neonatal preterm birth complications <28wks	4
Moderate motor impairment with blindness due to neonatal preterm birth complications <28wks	4
Moderate motor impairment with epilepsy due to neonatal preterm birth complications <28wks	4
Moderate motor impairment with blindness and epilepsy due to neonatal preterm birth complications <28wks	4
Moderate motor plus cognitive impairment with blindness due to neonatal preterm birth complications <28wks	4
Moderate motor plus cognitive impairment with epilepsy due to neonatal preterm birth complications <28wks	4
Moderate motor plus cognitive impairment with blindness and epilepsy due to neonatal preterm birth complications <28wks	4
Severe motor impairment due to neonatal preterm birth complications <28wks	4
Severe motor impairment with blindness due to neonatal preterm birth complications <28wks	4
Severe motor impairment with epilepsy due to neonatal preterm birth complications <28wks	4
Severe motor impairment with blindness and epilepsy due to neonatal preterm birth complications <28wks	4
Severe motor plus cognitive impairment with blindness due to neonatal preterm birth complications <28wks	4
Severe motor plus cognitive impairment with epilepsy due to neonatal preterm birth complications <28wks	4
Severe motor plus cognitive impairment with blindness and epilepsy due to neonatal preterm birth complications <28wks	4
Moderate motor impairment due to neonatal preterm birth complications 28-32wks	4
Moderate motor impairment with blindness due to neonatal preterm birth complications 28-32wks	4
Moderate motor impairment with epilepsy due to neonatal preterm birth complications 28-32wks	4
Moderate motor impairment with blindness and epilepsy due to neonatal preterm birth complications 28-32wks	4
Moderate motor plus cognitive impairment with blindness due to neonatal preterm birth complications 28-32wks	4
Moderate motor plus cognitive impairment with epilepsy due to neonatal preterm birth complications 28-32wks	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Moderate motor plus cognitive impairment with blindness and epilepsy due to neonatal preterm birth complications 28-32wks	4
Severe motor impairment due to neonatal preterm birth complications 28-32wks	4
Severe motor impairment with blindness due to neonatal preterm birth complications 28-32wks	4
Severe motor impairment with epilepsy due to neonatal preterm birth complications 28-32wks	4
Severe motor impairment with blindness and epilepsy due to neonatal preterm birth complications 28-32wks	4
Severe motor plus cognitive impairment with blindness due to neonatal preterm birth complications 28-32wks	4
Severe motor plus cognitive impairment with epilepsy due to neonatal preterm birth complications 28-32wks	4
Severe motor plus cognitive impairment with blindness and epilepsy due to neonatal preterm birth complications 28-32wks	4
Moderate motor impairment due to neonatal preterm birth complications 32-36wks	4
Moderate motor impairment with blindness due to neonatal preterm birth complications 32-36wks	4
Moderate motor impairment with epilepsy due to neonatal preterm birth complications 32-36wks	4
Moderate motor impairment with blindness and epilepsy due to neonatal preterm birth complications 32-36wks	4
Moderate motor plus cognitive impairment with blindness due to neonatal preterm birth complications 32-36wks	4
Moderate motor plus cognitive impairment with epilepsy due to neonatal preterm birth complications 32-36wks	4
Moderate motor plus cognitive impairment with blindness and epilepsy due to neonatal preterm birth complications 32-36wks	4
Severe motor impairment due to neonatal preterm birth complications 32-36wks	4
Severe motor impairment with blindness due to neonatal preterm birth complications 32-36wks	4
Severe motor impairment with epilepsy due to neonatal preterm birth complications 32-36wks	4
Severe motor impairment with blindness and epilepsy due to neonatal preterm birth complications 32-36wks	4
Severe motor plus cognitive impairment with blindness due to neonatal preterm birth complications 32-36wks	4
Severe motor plus cognitive impairment with epilepsy due to neonatal preterm birth complications 32-36wks	4
Severe motor plus cognitive impairment with blindness and epilepsy due to neonatal preterm birth complications 32-36wks	4
Neonatal encephalopathy due to birth asphyxia and trauma	3
Mild motor plus cognitive impairments due to neonatal encephalopathy due to birth asphyxia and trauma	4
Mild motor impairment due to neonatal encephalopathy due to birth asphyxia and trauma	4
Moderate motor impairment due to neonatal encephalopathy due to birth asphyxia and trauma	4
Moderate motor impairment with blindness due to neonatal encephalopathy due to birth asphyxia and trauma	4
Moderate motor impairment with epilepsy due to neonatal encephalopathy due to birth asphyxia and trauma	4
Moderate motor impairment with blindness and epilepsy due to neonatal encephalopathy due to birth asphyxia and trauma	4
Moderate motor plus cognitive impairment with blindness due to neonatal encephalopathy due to birth asphyxia and trauma	4
Moderate motor plus cognitive impairment with epilepsy due to neonatal encephalopathy due to birth asphyxia and trauma	4
Moderate motor plus cognitive impairment with blindness and epilepsy due to neonatal encephalopathy due to birth asphyxia and trauma	4
Severe motor impairment due to neonatal encephalopathy due to birth asphyxia and trauma	4
Severe motor impairment with blindness due to neonatal encephalopathy due to birth asphyxia and trauma	4
Severe motor impairment with epilepsy due to neonatal encephalopathy due to birth asphyxia and trauma	4
Severe motor impairment with blindness and epilepsy due to neonatal encephalopathy due to birth asphyxia and trauma	4
Severe motor plus cognitive impairment with blindness due to neonatal encephalopathy due to birth asphyxia and trauma	4
Severe motor plus cognitive impairment with epilepsy due to neonatal encephalopathy due to birth asphyxia and trauma	4
Severe motor plus cognitive impairment with blindness and epilepsy due to neonatal encephalopathy due to birth asphyxia and trauma	4
Neonatal sepsis and other neonatal infections	3
Hemolytic disease and other neonatal jaundice	3
Moderate motor impairment due to hemolytic disease and other neonatal jaundice	4
Moderate motor impairment with blindness due to hemolytic disease and other neonatal jaundice	4
Moderate motor impairment with epilepsy due to hemolytic disease and other neonatal jaundice	4
Moderate motor impairment with blindness and epilepsy due to hemolytic disease and other neonatal jaundice	4
Moderate motor plus cognitive impairment with blindness due to hemolytic disease and other neonatal jaundice	4
Moderate motor plus cognitive impairment with epilepsy due to hemolytic disease and other neonatal jaundice	4
Moderate motor plus cognitive impairment with blindness and epilepsy due to hemolytic disease and other neonatal jaundice	4
Severe motor impairment severe due to hemolytic disease and other neonatal jaundice	4
Severe motor impairment with blindness due to hemolytic disease and other neonatal jaundice	4
Severe motor impairment with epilepsy due to hemolytic disease and other neonatal jaundice	4
Severe motor impairment with blindness and epilepsy due to hemolytic disease and other neonatal jaundice	4
Severe motor plus cognitive impairment with blindness due to hemolytic disease and other neonatal jaundice	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Severe motor plus cognitive impairment with epilepsy due to hemolytic disease and other neonatal jaundice	4
Severe motor plus cognitive impairment with blindness and epilepsy due to hemolytic disease and other neonatal jaundice	4
Other neonatal disorders	3
Nutritional deficiencies	2
Protein-energy malnutrition	3
Kwashiorkor due to protein-energy malnutrition	4
Marasmus due to protein-energy malnutrition	4
Severe wasting due to protein-energy malnutrition	4
Iodine deficiency	3
Visible goiter without symptoms	4
Visible goiter without heart failure due to iodine deficiency	4
Visible goiter with mild heart failure due to iodine deficiency	4
Visible goiter with moderate heart failure due to iodine deficiency	4
Visible goiter with severe heart failure due to iodine deficiency	4
Visible goiter with signs and symptoms	4
Severe intellectual disability due to iodine deficiency	4
Profound intellectual disability due to iodine deficiency	4
Vitamin A deficiency	3
Moderate vision impairment loss due to vitamin A deficiency	4
Severe vision impairment loss due to vitamin A deficiency	4
Blindness due to vitamin A deficiency	4
Iron-deficiency anemia	3
Mild iron-deficiency anemia	4
Moderate iron-deficiency anemia	4
Severe iron-deficiency anemia	4
Mild heart failure due to iron-deficiency anemia	4
Moderate heart failure due to iron-deficiency anemia	4
Severe heart failure due to iron-deficiency anemia	4
Other nutritional deficiencies	3
Other communicable, maternal, neonatal, and nutritional diseases	2
Sexually transmitted diseases excluding HIV	3
Syphilis	4
Chlamydial infection	4
Asymptomatic chlamydial infection	5
Mild chlamydial infection	5
Epididymo-orchitis due to chlamydial infection	5
Moderate pelvic inflammatory diseases due to chlamydial infection	5
Severe pelvic inflammatory diseases due to chlamydial infection	5
Primary infertility due to chlamydial infection	5
Secondary infertility due to chlamydial infection	5
Gonococcal infection	4
Asymptomatic gonococcal infection	5
Mild gonococcal infection	5
Epididymo-orchitis due to gonococcal infection	5
Moderate pelvic inflammatory diseases due to gonococcal infection	5
Severe pelvic inflammatory diseases due to gonococcal infection	5
Primary infertility due to gonococcal infection	5
Secondary infertility due to gonococcal infection	5
Trichomoniasis	4
Asymptomatic trichomoniasis infection	5
Acute trichomoniasis infection	5
Genital herpes	4
Asymptomatic genital herpes	5

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Symptomatic genital herpes	5
Moderate infection due to initial genital herpes episode	5
Other sexually transmitted diseases	4
Other sexually transmitted diseases	5
Moderate pelvic inflammatory diseases due to other sexually transmitted diseases	5
Severe pelvic inflammatory diseases due to other sexually transmitted diseases	5
Primary infertility due to other sexually transmitted diseases	5
Secondary infertility due to other sexually transmitted diseases	5
Hepatitis	3
Hepatitis A	4
Asymptomatic acute hepatitis A	5
Mild acute hepatitis A	5
Moderate acute hepatitis A	5
Severe acute hepatitis A	5
Hepatitis B	4
Asymptomatic acute hepatitis B	5
Moderate acute hepatitis B	5
Severe acute hepatitis B	5
Chronic Hepatitis B	5
Hepatitis C	4
Asymptomatic acute hepatitis C	5
Moderate acute hepatitis C	5
Severe acute hepatitis C	5
Chronic Hepatitis C	5
Hepatitis E	4
Asymptomatic acute hepatitis E	5
Moderate acute hepatitis E	5
Severe acute hepatitis E	5
Leprosy	3
Disfigurement level 1 due to leprosy	4
Disfigurement level 2 due to leprosy	4
Other infectious diseases	3
Acute other infectious diseases	4
Mild anemia due to other infectious diseases	4
Moderate anemia due to other infectious diseases	4
Severe anemia due to other infectious diseases	4
Guillain-Barré syndrome due to other infectious diseases	4
Non-communicable diseases	1
Neoplasms	2
Esophageal cancer	3
Diagnosis and primary therapy phase of esophageal cancer	4
Controlled phase of esophageal cancer	4
Metastatic phase of esophageal cancer	4
Terminal phase of esophageal cancer	4
Stomach cancer	3
Diagnosis and primary therapy phase of stomach cancer	4
Controlled phase of stomach cancer	4
Metastatic phase of stomach cancer	4
Terminal phase of stomach cancer	4
Liver cancer	3
Liver cancer due to hepatitis B	4
Diagnosis and primary therapy phase of liver cancer due to hepatitis B	5
Controlled phase of liver cancer due to hepatitis B	5

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Metastatic phase of liver cancer due to hepatitis B	5
Terminal phase of liver cancer due to hepatitis B	5
Liver cancer due to hepatitis C	4
Diagnosis and primary therapy phase of liver cancer due to hepatitis C	5
Controlled phase of liver cancer due to hepatitis C	5
Metastatic phase of liver cancer due to hepatitis C	5
Terminal phase of liver cancer due to hepatitis C	5
Liver cancer due to alcohol use	4
Diagnosis and primary therapy phase of liver cancer due to alcohol use	5
Controlled phase of liver cancer due to alcohol use	5
Metastatic phase of liver cancer due to alcohol use	5
Terminal phase of liver cancer due to alcohol use	5
Liver cancer due to other causes	4
Diagnosis and primary therapy phase of liver cancer due to other causes	5
Controlled phase of liver cancer due to other causes	5
Metastatic phase of liver cancer due to other causes	5
Terminal phase of liver cancer due to other causes	5
Larynx cancer	3
Diagnosis and primary therapy phase of larynx cancer	4
Controlled phase of larynx cancer	4
Metastatic phase of larynx cancer	4
Terminal phase of larynx cancer	4
Laryngectomy due to larynx cancer	4
Tracheal, bronchus and lung cancer	3
Diagnosis and primary therapy phase of lung, bronchus, and trachea cancer	4
Controlled phase of lung, bronchus, and trachea cancer	4
Metastatic phase of lung, bronchus, and trachea cancer	4
Terminal phase of lung, bronchus, and trachea cancer	4
Breast cancer	3
Diagnosis and primary therapy phase of breast cancer	4
Controlled phase of breast cancer	4
Metastatic phase of breast cancer	4
Terminal phase of breast cancer	4
Mastectomy due to breast cancer	4
Cervical cancer	3
Diagnosis and primary therapy phase of cervical cancer	4
Controlled phase of cervical cancer	4
Metastatic phase of cervical cancer	4
Terminal phase of cervical cancer	4
Uterine cancer	3
Diagnosis and primary therapy phase of uterine cancer	4
Controlled phase of uterine cancer	4
Metastatic phase of uterine cancer	4
Terminal phase of uterine cancer	4
Prostate cancer	3
Diagnosis and primary therapy phase of prostate cancer	4
Controlled phase of prostate cancer	4
Metastatic phase of prostate cancer	4
Terminal phase of prostate cancer	4
Impotence due to prostate cancer	4
Incontinence due to prostate cancer	4
Colon and rectum cancer	3
Diagnosis and primary therapy phase of colon and rectum cancers	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Controlled phase of colon and rectum cancers	4
Metastatic phase of colon and rectum cancers	4
Terminal phase of colon and rectum cancers	4
Stoma due to colon and rectum cancer	4
Lip and oral cavity cancer	3
Diagnosis and primary therapy phase of mouth cancer	4
Controlled phase of mouth cancer	4
Metastatic phase of mouth cancer	4
Terminal phase of mouth cancer	4
Nasopharynx cancer	3
Diagnosis and primary therapy phase of nasopharynx cancer	4
Controlled phase of nasopharynx cancer	4
Metastatic phase of nasopharynx cancer	4
Terminal phase of nasopharynx cancer	4
Other pharynx cancer	3
Diagnosis and primary therapy phase of other pharynx cancer	4
Controlled phase of other pharynx cancer	4
Metastatic phase of other pharynx cancer	4
Terminal phase of other pharynx cancer	4
Gallbladder and biliary tract cancer	3
Diagnosis and primary therapy phase of gallbladder and biliary tract cancer	4
Controlled phase of gallbladder and biliary tract cancer	4
Metastatic phase of gallbladder and biliary tract cancer	4
Terminal phase of gallbladder and biliary tract cancer	4
Pancreatic cancer	3
Diagnosis and primary therapy phase of pancreatic cancer	4
Controlled phase of pancreatic cancer	4
Metastatic phase of pancreatic cancer	4
Terminal phase of pancreatic cancer	4
Malignant skin melanoma	3
Diagnosis and primary therapy phase of malignant skin melanoma	4
Controlled phase of malignant skin melanoma	4
Metastatic phase of malignant skin melanoma	4
Terminal phase of malignant skin melanoma	4
Non-melanoma skin cancer	3
Diagnosis and primary therapy phase of cutaneous squamous cell carcinoma	4
Control phase of cutaneous squamous cell carcinoma	4
Metastatic phase of cutaneous squamous cell carcinoma	4
Terminal phase of cutaneous squamous cell carcinoma	4
Disfigurement due to basal cell carcinoma	4
Ovarian cancer	3
Diagnosis and primary therapy phase of ovarian cancer	4
Controlled phase of ovarian cancer	4
Metastatic phase of ovarian cancer	4
Terminal phase of ovarian cancer	4
Testicular cancer	3
Diagnosis and primary therapy phase of testicular cancer	4
Controlled phase of testicular cancer	4
Metastatic phase of testicular cancer	4
Terminal phase of testicular cancer	4
Kidney cancer	3
Diagnosis and primary therapy phase of kidney cancer	4
Controlled phase of kidney cancer	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Metastatic phase of kidney cancer	4
Terminal phase of kidney cancer	4
Bladder cancer	3
Diagnosis and primary therapy phase of bladder cancer	4
Controlled phase of bladder cancer	4
Metastatic phase of bladder cancer	4
Terminal phase of bladder cancer	4
Urinary incontinence due to bladder cancer	4
Brain and nervous system cancer	3
Diagnosis and primary therapy phase of brain and nervous system cancers	4
Controlled phase of brain and nervous system cancers	4
Metastatic phase of brain and nervous system cancers	4
Terminal phase of brain and nervous system cancers	4
Thyroid cancer	3
Diagnosis and primary therapy phase of thyroid cancer	4
Controlled phase of thyroid cancer	4
Metastatic phase of thyroid cancer	4
Terminal phase of thyroid cancer	4
Mesothelioma	3
Diagnosis and primary therapy phase of mesothelioma	4
Controlled phase of mesothelioma	4
Metastatic phase of mesothelioma	4
Terminal phase of mesothelioma	4
Hodgkin lymphoma	3
Diagnosis and primary therapy phase of Hodgkin disease	4
Controlled phase of Hodgkin disease	4
Metastatic phase of Hodgkin disease	4
Terminal phase of Hodgkin disease	4
Non-Hodgkin lymphoma	3
Diagnosis and primary therapy phase of non-Hodgkin lymphoma	4
Controlled phase of non-Hodgkin lymphoma	4
Metastatic phase of non-Hodgkin lymphoma	4
Terminal phase of non-Hodgkin lymphoma	4
Multiple myeloma	3
Diagnosis and primary therapy phase of multiple myeloma	4
Controlled phase of multiple myeloma	4
Metastatic phase of multiple myeloma	4
Terminal phase of multiple myeloma	4
Leukemia	3
Diagnosis and primary therapy phase of leukemia	4
Controlled phase of leukemia	4
Metastatic phase of leukemia	4
Terminal phase of leukemia	4
Other neoplasms	3
Diagnosis and primary therapy phase of other neoplasms	4
Controlled phase of other neoplasms	4
Metastatic phase of other neoplasms	4
Terminal phase of other neoplasms	4
Cardiovascular diseases	2
Rheumatic heart disease	3
Rheumatic heart disease, without heart failure	4
Mild heart failure due to rheumatic heart disease	4
Moderate heart failure due to rheumatic heart disease	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Severe heart failure due to rheumatic heart disease	4
Ischemic heart disease	3
Asymptomatic ischemic heart disease following myocardial infarction	4
Acute myocardial infarction first 2 days	4
Acute myocardial infarction 3 to 28 days	4
Asymptomatic angina due to ischemic heart disease	4
Mild angina due to ischemic heart disease	4
Moderate angina due to ischemic heart disease	4
Severe angina due to ischemic heart disease	4
Mild heart failure due to ischemic heart disease	4
Moderate heart failure due to ischemic heart disease	4
Severe heart failure due to ischemic heart disease	4
Cerebrovascular disease	3
Ischemic stroke	4
Asymptomatic chronic ischemic stroke	5
Chronic ischemic stroke severity level 1	5
Chronic ischemic stroke severity level 2	5
Chronic ischemic stroke severity level 4	5
Chronic ischemic stroke severity level 3	5
Chronic ischemic stroke severity level 5	5
Acute ischemic stroke severity level 1	5
Acute ischemic stroke severity level 2	5
Acute ischemic stroke severity level 4	5
Acute ischemic stroke severity level 3	5
Acute ischemic stroke severity level 5	5
Hemorrhagic stroke	4
Asymptomatic chronic hemorrhagic stroke	5
Chronic hemorrhagic stroke severity level 1	5
Chronic hemorrhagic stroke severity level 2	5
Chronic hemorrhagic stroke severity level 4	5
Chronic hemorrhagic stroke severity level 3	5
Chronic hemorrhagic stroke severity level 5	5
Acute hemorrhagic stroke severity level 1	5
Acute hemorrhagic stroke severity level 2	5
Acute hemorrhagic stroke severity level 4	5
Acute hemorrhagic stroke severity level 3	5
Acute hemorrhagic stroke severity level 5	5
Hypertensive heart disease	3
Mild heart failure due to hypertensive heart disease	4
Moderate heart failure due to hypertensive heart disease	4
Severe heart failure due to hypertensive heart disease	4
Cardiomyopathy and myocarditis	3
Acute myocarditis	4
Mild heart failure due to cardiomyopathy and myocarditis	4
Moderate heart failure due to cardiomyopathy and myocarditis	4
Severe heart failure due to cardiomyopathy and myocarditis	4
Atrial fibrillation and flutter	3
Asymptomatic atrial fibrillation and flutter	4
Symptomatic atrial fibrillation and flutter	4
Peripheral vascular disease	3
Asymptomatic peripheral vascular disease	4
Symptomatic claudication due to peripheral vascular disease	4
Endocarditis	3

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Moderate endocarditis	4
Severe endocarditis	4
Mild heart failure due to endocarditis	4
Moderate heart failure due to endocarditis	4
Severe heart failure due to endocarditis	4
Other cardiovascular and circulatory diseases	3
Mild heart failure due to other cardiovascular diseases	4
Moderate heart failure due to other cardiovascular diseases	4
Severe heart failure due to other cardiovascular diseases	4
Asymptomatic other cardiovascular diseases	4
Mild other cardiovascular diseases	4
Moderate other cardiovascular diseases	4
Severe other cardiovascular diseases	4
Chronic respiratory diseases	2
Chronic obstructive pulmonary disease	3
Asymptomatic chronic obstructive pulmonary disease	4
Mild chronic obstructive pulmonary disease	4
Moderate chronic obstructive pulmonary disease	4
Severe chronic obstructive pulmonary disease without heart failure	4
Mild heart failure due to severe chronic obstructive pulmonary disease	4
Moderate heart failure due to severe chronic obstructive pulmonary disease	4
Severe heart failure due to severe chronic obstructive pulmonary disease	4
Pneumoconiosis	3
Silicosis	4
Asymptomatic silicosis	5
Mild silicosis	5
Moderate silicosis	5
Severe silicosis without heart failure	5
Mild heart failure due to severe silicosis	5
Moderate heart failure due to severe silicosis	5
Severe heart failure due to severe silicosis	5
Asbestosis	4
Asymptomatic asbestosis	5
Mild asbestosis	5
Moderate asbestosis	5
Severe asbestosis without heart failure	5
Mild heart failure due to severe asbestosis	5
Moderate heart failure due to severe asbestosis	5
Severe heart failure due to severe asbestosis	5
Coal workers pneumoconiosis	4
Asymptomatic coal workers pneumoconiosis	5
Mild coal workers pneumoconiosis	5
Moderate coal workers pneumoconiosis	5
Severe coal workers pneumoconiosis without heart failure	5
Mild heart failure due to severe coal workers pneumoconiosis	5
Moderate heart failure due to severe coal workers pneumoconiosis	5
Severe heart failure due to severe coal workers pneumoconiosis	5
Other pneumoconiosis	4
Asymptomatic other pneumoconiosis	5
Mild other pneumoconiosis	5
Moderate other pneumoconiosis	5
Severe other pneumoconiosis without heart failure	5
Mild heart failure due to severe other pneumoconiosis	5

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Moderate heart failure due to severe other pneumoconiosis	5
Severe heart failure due to severe other pneumoconiosis	5
Asthma	3
Asymptomatic asthma	4
Controlled asthma	4
Partially controlled asthma	4
Uncontrolled asthma	4
Interstitial lung disease and pulmonary sarcoidosis	3
Asymptomatic interstitial lung disease and pulmonary sarcoidosis	4
Mild interstitial lung disease and pulmonary sarcoidosis	4
Moderate interstitial lung disease and pulmonary sarcoidosis	4
Severe interstitial lung disease and pulmonary sarcoidosis without heart failure	4
Mild heart failure due to severe interstitial lung disease and pulmonary sarcoidosis	4
Moderate heart failure due to severe interstitial lung disease and pulmonary sarcoidosis	4
Severe heart failure due to severe interstitial lung disease and pulmonary sarcoidosis	4
Other chronic respiratory diseases	3
Cirrhosis	2
Cirrhosis due to hepatitis B	3
Cirrhosis due to hepatitis C	3
Cirrhosis due to alcohol use	3
Cirrhosis due to other causes	3
Digestive diseases	2
Peptic ulcer disease	3
Peptic ulcer disease, symptomatic episodes	4
Mild anemia due to peptic ulcer disease	4
Moderate anemia due to peptic ulcer disease	4
Severe anemia due to peptic ulcer disease	4
Gastritis and duodenitis	3
Gastritis and duodenitis, symptomatic episodes	4
Mild anemia due to gastritis and duodenitis	4
Moderate anemia due to gastritis and duodenitis	4
Severe anemia due to gastritis and duodenitis	4
Appendicitis	3
Paralytic ileus and intestinal obstruction	3
Inguinal, femoral, and abdominal hernia	3
Inflammatory bowel disease	3
Ulcerative colitis	4
Crohn's disease	4
Vascular intestinal disorders	3
Gallbladder and biliary diseases	3
Pancreatitis	3
Other digestive diseases	3
Neurological disorders	2
Alzheimer disease and other dementias	3
Mild Alzheimer disease and other dementias	4
Moderate Alzheimer disease and other dementias	4
Severe Alzheimer disease and other dementias	4
Parkinson disease	3
Mild Parkinson disease	4
Moderate Parkinson disease	4
Severe Parkinson disease	4
Epilepsy	3
Seizure-free, treated epilepsy	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Less severe epilepsy	4
Severe epilepsy	4
Multiple sclerosis	3
Mild multiple sclerosis	4
Moderate multiple sclerosis	4
Severe multiple sclerosis	4
Migraine	3
Asymptomatic migraine	4
Symptomatic migraine	4
Tension-type headache	3
Asymptomatic tension-type headache	4
Symptomatic tension-type headache	4
Medication overuse headache	3
Asymptomatic medication overuse headache	4
Symptomatic medication overuse headache	4
Other neurological disorders	3
Other neurological disorders	4
Guillain-Barré syndrome due to other neurological disorders	4
Mental and substance use disorders	2
Schizophrenia	3
Schizophrenia residual state	4
Schizophrenia acute state	4
Alcohol use disorders	3
Asymptomatic alcohol dependence	4
Very mild alcohol dependence	4
Mild alcohol dependence	4
Moderate alcohol dependence	4
Severe alcohol dependence	4
Asymptomatic fetal alcohol syndrome	4
Mild fetal alcohol syndrome	4
Moderate fetal alcohol syndrome	4
Severe fetal alcohol syndrome	4
Drug use disorders	3
Opioid use disorders	4
Asymptomatic opioid dependence	5
Mild opioid dependence	5
Severe opioid dependence	5
Cocaine use disorders	4
Asymptomatic cocaine dependence	5
Mild cocaine dependence	5
Severe cocaine dependence	5
Amphetamine use disorders	4
Asymptomatic amphetamine dependence	5
Mild amphetamine dependence	5
Severe amphetamine dependence	5
Cannabis use disorders	4
Asymptomatic cannabis dependence	5
Mild cannabis dependence	5
Severe cannabis dependence	5
Other drug use disorders	4
Depressive disorders	3
Major depressive disorder	4
Major depressive disorder, currently without symptoms	5

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Mild major depressive disorder	5
Moderate major depressive disorder	5
Severe major depressive disorder	5
Dysthymia	4
Dysthymia, currently without symptoms	5
Symptomatic dysthymia	5
Bipolar disorder	3
Bipolar disorder residual state	4
Bipolar disorder depressive state	4
Bipolar disorder manic state	4
Anxiety disorders	3
Anxiety disorders, currently without symptoms	4
Mild anxiety disorders	4
Moderate anxiety disorders	4
Severe anxiety disorders	4
Eating disorders	3
Anorexia nervosa	4
Bulimia nervosa	4
Autistic spectrum disorders	3
Autism	4
Asperger syndrome	4
Attention-deficit/hyperactivity disorder	3
Attention-deficit/hyperactivity disorder, currently without symptoms	4
Symptomatic attention-deficit/hyperactivity disorder	4
Conduct disorder	3
Conduct disorder, currently without symptoms	4
Symptomatic conduct disorder	4
Idiopathic intellectual disability	3
Borderline idiopathic intellectual disability	4
Mild idiopathic intellectual disability	4
Moderate idiopathic intellectual disability	4
Severe idiopathic intellectual disability	4
Profound idiopathic intellectual disability	4
Other mental and substance use disorders	3
Other mental disorders, currently without symptoms	4
Mild other mental disorders	4
Moderate other mental disorders	4
Severe other mental disorders	4
Diabetes, urogenital, blood, and endocrine diseases	2
Diabetes mellitus	3
Uncomplicated diabetes mellitus	4
Diabetic neuropathy	4
Diabetic foot due to neuropathy	4
Diabetic neuropathy and amputation with treatment	4
Diabetic neuropathy and amputation without treatment	4
Moderate vision impairment due to diabetes mellitus	4
Severe vision impairment due to diabetes mellitus	4
Blindness due to diabetes mellitus	4
Acute glomerulonephritis	3
Chronic kidney disease	3
Chronic kidney disease due to diabetes mellitus	4
Stage III chronic kidney disease without anemia due to diabetes mellitus	5
Stage III chronic kidney disease and mild anemia due to diabetes mellitus	5

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Stage III chronic kidney disease and moderate anemia due to diabetes mellitus	5
Stage III chronic kidney disease and severe anemia due to diabetes mellitus	5
Stage IV chronic kidney disease without anemia due to diabetes mellitus	5
Stage IV chronic kidney disease and mild anemia due to diabetes mellitus	5
Stage IV chronic kidney disease and moderate anemia due to diabetes mellitus	5
Stage IV chronic kidney disease and severe anemia due to diabetes mellitus	5
Stage V chronic kidney disease untreated due to diabetes mellitus	5
End-stage renal disease after transplant due to diabetes mellitus	5
End-stage renal disease on dialysis due to diabetes mellitus	5
Chronic kidney disease due to hypertension	4
Stage III chronic kidney disease without anemia due to hypertension	5
Stage III chronic kidney disease and mild anemia due to hypertension	5
Stage III chronic kidney disease and moderate anemia due to hypertension	5
Stage III chronic kidney disease and severe anemia due to hypertension	5
Stage IV chronic kidney disease without anemia due to hypertension	5
Stage IV chronic kidney disease and mild anemia due to hypertension	5
Stage IV chronic kidney disease and moderate anemia due to hypertension	5
Stage IV chronic kidney disease and severe anemia due to hypertension	5
Stage V chronic kidney disease untreated due to hypertension	5
End-stage renal disease after transplant due to hypertension	5
End-stage renal disease on dialysis due to hypertension	5
Chronic kidney disease due to glomerulonephritis	4
Stage III chronic kidney disease without anemia due to glomerulonephritis	5
Stage III chronic kidney disease and mild anemia due to glomerulonephritis	5
Stage III chronic kidney disease and moderate anemia due to glomerulonephritis	5
Stage III chronic kidney disease and severe anemia due to glomerulonephritis	5
Stage IV chronic kidney disease without anemia due to glomerulonephritis	5
Stage IV chronic kidney disease and mild anemia due to glomerulonephritis	5
Stage IV chronic kidney disease and moderate anemia due to glomerulonephritis	5
Stage IV chronic kidney disease and severe anemia due to glomerulonephritis	5
Stage V chronic kidney disease untreated due to glomerulonephritis	5
End-stage renal disease after transplant due to glomerulonephritis	5
End-stage renal disease on dialysis due to glomerulonephritis	5
Chronic kidney disease due to other causes	4
Stage III chronic kidney disease without anemia due to other causes	5
Stage III chronic kidney disease and mild anemia due to other causes	5
Stage III chronic kidney disease and moderate anemia due to other causes	5
Stage III chronic kidney disease and severe anemia due to other causes	5
Stage IV chronic kidney disease without anemia due to other causes	5
Stage IV chronic kidney disease and mild anemia due to other causes	5
Stage IV chronic kidney disease and moderate anemia due to other causes	5
Stage IV chronic kidney disease and severe anemia due to other causes	5
Stage V chronic kidney disease untreated due to other causes	5
End-stage renal disease after transplant due to other causes	5
End-stage renal disease on dialysis due to other causes	5
Urinary diseases and male infertility	3
Interstitial nephritis and urinary tract infections	4
Mild interstitial nephritis and urinary tract infections	5
Moderate interstitial nephritis and urinary tract infections	5
Urolithiasis	4
Acute urolithiasis	5
Chronic urolithiasis	5
Benign prostatic hyperplasia	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Asymptomatic benign prostatic hyperplasia	5
Symptomatic benign prostatic hyperplasia	5
Male infertility due to other causes	4
Primary male infertility	5
Secondary male infertility	5
Other urinary diseases	4
Gynecological diseases	3
Uterine fibroids	4
Asymptomatic uterine fibroids	5
Mild abdominal pain due to uterine fibroids, without anemia	5
Mild abdominal pain due to uterine fibroids, with mild anemia	5
Mild abdominal pain due to uterine fibroids, with moderate anemia	5
Mild abdominal pain due to uterine fibroids, with severe anemia	5
Polycystic ovarian syndrome	4
Asymptomatic polycystic ovarian syndrome	5
Hirsutism due to polycystic ovarian syndrome	5
Hirsutism and primary infertility due to polycystic ovarian syndrome	5
Primary infertility due to polycystic ovarian syndrome	5
Hirsutism and secondary infertility due to polycystic ovarian syndrome	5
Secondary infertility due to polycystic ovarian syndrome	5
Female infertility due to other causes	4
Idiopathic primary female infertility	5
Idiopathic secondary female infertility	5
Endometriosis	4
Asymptomatic endometriosis	5
Mild abdominal pain due to endometriosis	5
Moderate abdominal pain due to endometriosis	5
Severe endometriosis	5
Primary infertility due to endometriosis	5
Mild abdominal pain and primary infertility due to endometriosis	5
Moderate abdominal pain and primary infertility due to endometriosis	5
Severe abdominal pain and primary infertility due to endometriosis	5
Secondary infertility due to endometriosis	5
Mild abdominal pain and secondary infertility due to endometriosis	5
Moderate abdominal pain and secondary infertility due to endometriosis	5
Severe abdominal pain and secondary infertility due to endometriosis	5
Genital prolapse	4
Asymptomatic genital prolapse	5
Abdominal pain due to genital prolapse	5
Stress incontinence due to genital prolapse	5
Abdominal pain and stress incontinence due to genital prolapse	5
Premenstrual syndrome	4
Asymptomatic premenstrual syndrome	5
Abdominal pain and depression due to premenstrual syndrome	5
Abdominal pain due to premenstrual syndrome	5
Depression due to premenstrual syndrome	5
Other gynecological diseases	4
Asymptomatic other gynecological disorders	5
Mild other gynecological disorders	5
Moderate other gynecological disorders	5
Severe other gynecological disorders	5
Mild anemia due to other gynecological diseases	5
Moderate anemia due to other gynecological diseases	5

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Severe anemia due to other gynecological diseases	5
Hemoglobinopathies and hemolytic anemias	3
Thalassemias	4
Beta-thalassemia major, with mild anemia	5
Beta-thalassemia major, with moderate anemia	5
Beta-thalassemia major, with severe anemia	5
Beta-thalassemia major, severe infection with severe anemia	5
Hemoglobin E/beta-thalassemia, with mild anemia	5
Hemoglobin E/beta-thalassemia, with moderate anemia	5
Hemoglobin E/beta-thalassemia, with severe anemia	5
Hemoglobin E/beta-thalassemia, severe infection with severe anemia	5
Hemoglobin H disease, with mild anemia	5
Hemoglobin H disease, with moderate anemia	5
Hemoglobin H disease, with severe anemia	5
Hemoglobin H disease, severe infection with severe anemia	5
Mild heart failure due to thalassemias	5
Moderate heart failure due to thalassemias	5
Severe heart failure due to thalassemias	5
Hemoglobin H disease, without anemia	5
Beta-thalassemia major, without anemia	5
Hemoglobin E/Beta-thalassemia, without anemia	5
Thalassemia trait	4
Asymptomatic B-thalassemia trait	5
Mild anemia due to B-thalassemia trait	5
Moderate anemia due to B-thalassemia trait	5
Severe anemia due to B-thalassemia trait	5
Asymptomatic hemoglobin E trait	5
Mild anemia due to hemoglobin E trait	5
Moderate anemia due to hemoglobin E trait	5
Severe anemia due to hemoglobin E trait	5
Sickle cell disorders	4
Homozygous sickle cell and severe sickle cell/beta-thalassemia, without anemia	5
Homozygous sickle cell and severe sickle cell/beta-thalassemia, with vaso-occlusive crisis, without anemia	5
Homozygous sickle cell and severe sickle cell/beta-thalassemia, with stroke, without anemia	5
Homozygous sickle cell and severe sickle cell/beta-thalassemia, with vaso-occlusive crisis and stroke, without anemia	5
Homozygous sickle cell and severe sickle cell/beta-thalassemia, with mild anemia	5
Homozygous sickle cell and severe sickle cell/beta-thalassemia, with moderate anemia	5
Homozygous sickle cell and severe sickle cell/beta-thalassemia, with severe anemia	5
Homozygous sickle cell and severe sickle cell/beta-thalassemia, with vaso-occlusive crisis and severe anemia	5
Homozygous sickle cell and severe sickle cell/beta-thalassemia, with stroke and severe anemia	5
Homozygous sickle cell and severe sickle cell/beta-thalassemia, with vaso-occlusive crisis, stroke, and severe anemia	5
Hemoglobin SC disease, without anemia	5
Hemoglobin SC disease, with vaso-occlusive crisis, without anemia	5
Hemoglobin SC disease, with stroke, without anemia	5
Hemoglobin SC disease, with vaso-occlusive crisis and stroke, without anemia	5
Hemoglobin SC disease, with mild anemia	5
Hemoglobin SC disease, with moderate anemia	5
Hemoglobin SC disease, with severe anemia	5
Hemoglobin SC disease, with vaso-occlusive crisis and severe anemia	5
Hemoglobin SC disease, with stroke and severe anemia	5
Hemoglobin SC disease, with vaso-occlusive crisis, stroke, and severe anemia	5
Mild sickle cell/beta-thalassemia, without anemia	5
Mild sickle cell/beta-thalassemia, with vaso-occlusive crisis, without anemia	5

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Mild sickle cell/beta-thalassemia, with stroke, without anemia	5
Mild sickle cell/beta-thalassemia, with vaso-occlusive crisis and stroke, without anemia	5
Mild sickle cell/beta-thalassemia, with mild anemia	5
Mild sickle cell/beta-thalassemia, with moderate anemia	5
Mild sickle cell/beta-thalassemia, with severe anemia	5
Mild sickle cell/beta-thalassemia, with vaso-occlusive crisis and severe anemia	5
Mild sickle cell/beta-thalassemia, with stroke and severe anemia	5
Mild sickle cell/beta-thalassemia, with vaso-occlusive crisis, stroke, and severe anemia	5
Sickle cell trait	4
Asymptomatic sickle cell trait	5
Mild anemia due to sickle cell trait	5
Moderate anemia due to sickle cell trait	5
Severe anemia due to sickle cell trait	5
G6PD deficiency	4
Mild anemia due to G6PD deficiency	5
Moderate anemia due to G6PD deficiency	5
Severe anemia due to G6PD deficiency	5
Mild heart failure due to G6PD deficiency	5
Moderate heart failure due to G6PD deficiency	5
Severe heart failure due to G6PD deficiency	5
Asymptomatic G6PD deficiency	5
G6PD trait	4
Asymptomatic hemizygous G6PD deficiency	5
Mild anemia due to hemizygous G6PD deficiency	5
Moderate anemia due to hemizygous G6PD deficiency	5
Severe anemia due to hemizygous G6PD deficiency	5
Other hemoglobinopathies and hemolytic anemias	4
Other hemoglobinopathies and hemolytic anemias	5
Mild anemia due to other hemoglobinopathies and hemolytic anemias	5
Moderate anemia due to other hemoglobinopathies and hemolytic anemias	5
Severe anemia due to other hemoglobinopathies and hemolytic anemias	5
Mild heart failure due to other hemoglobinopathies and hemolytic anemias	5
Moderate heart failure due to other hemoglobinopathies and hemolytic anemias	5
Severe heart failure due to other hemoglobinopathies and hemolytic anemias	5
Endocrine, metabolic, blood, and immune disorders	3
Asymptomatic endocrine, metabolic, blood, and immune disorders	4
Mild endocrine, metabolic, blood, and immune disorders	4
Moderate endocrine, metabolic, blood, and immune disorders	4
Severe endocrine, metabolic, blood, and immune disorders	4
Mild anemia due to endocrine, metabolic, blood, and immune disorders	4
Moderate anemia due to endocrine, metabolic, blood, and immune disorders	4
Severe anemia due to endocrine, metabolic, blood, and immune disorders	4
Mild heart failure due to endocrine, metabolic, blood, and immune disorders	4
Moderate heart failure due to endocrine, metabolic, blood, and immune disorders	4
Severe heart failure due to endocrine, metabolic, blood, and immune disorders	4
Musculoskeletal disorders	2
Rheumatoid arthritis	3
Mild rheumatoid arthritis	4
Moderate rheumatoid arthritis	4
Severe rheumatoid arthritis	4
Osteoarthritis	3
Mild osteoarthritis of the hip	4
Moderate osteoarthritis of the hip	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Severe osteoarthritis of the hip	4
Mild osteoarthritis of the knee	4
Moderate osteoarthritis of the knee	4
Severe osteoarthritis of the knee	4
Low back and neck pain	3
Low back pain	4
Mild low back pain without leg pain	5
Mild low back pain with leg pain	5
Moderate low back pain without leg pain	5
Moderate low back pain with leg pain	5
Severe low back pain without leg pain	5
Severe low back pain with leg pain	5
Most severe low back pain without leg pain	5
Most severe low back pain with leg pain	5
Neck pain	4
Mild neck pain	5
Moderate neck pain	5
Severe neck pain	5
Most severe neck pain	5
Gout	3
Asymptomatic gout	4
Symptomatic episodes of gout	4
Polyarticular gout	4
Other musculoskeletal disorders	3
Asymptomatic other musculoskeletal disorders	4
Other musculoskeletal disorders severity level 2	4
Other musculoskeletal disorders severity level 3	4
Other musculoskeletal disorders severity level 5	4
Other musculoskeletal disorders severity level 6	4
Other musculoskeletal disorders severity level 1	4
Other musculoskeletal disorders severity level 4	4
Other non-communicable diseases	2
Congenital anomalies	3
Neural tube defects	4
Moderate motor impairment due to moderate neural tube defects	5
Severe motor impairment due to severe neural tube defects	5
Severe motor plus cognitive impairments due to severe neural tube defects	5
Severe motor impairment with incontinence due to severe neural tube defects	5
Congenital heart anomalies	4
Asymptomatic less severe congenital heart anomalies	5
Symptomatic less severe congenital heart anomalies	5
Severe congenital heart anomalies	5
Critical congenital heart anomalies	5
Mild heart failure due to congenital heart anomalies	5
Moderate heart failure due to congenital heart anomalies	5
Severe heart failure due to congenital heart anomalies	5
Orofacial clefts	4
Asymptomatic orofacial clefts	5
Disfigurement level 1 due to orofacial clefts	5
Disfigurement level 2 due to orofacial clefts	5
Disfigurement level 2 and speech problems due to orofacial clefts	5
Down syndrome	4
Asymptomatic Down syndrome	5

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Intellectual disability due to Down syndrome	5
Intellectual disability with congenital heart disease due to Down syndrome	5
Intellectual disability with dementia due to Down syndrome	5
Intellectual disability with congenital heart disease and dementia due to Down syndrome	5
Isolated congenital heart disease due to Down syndrome	5
Turner syndrome	4
Asymptomatic Turner syndrome	5
Congenital heart disease due to Turner syndrome	5
Primary infertility due to Turner syndrome	5
Congenital heart disease with infertility due to Turner syndrome	5
Klinefelter syndrome	4
Asymptomatic Klinefelter syndrome	5
Borderline intellectual disability due to Klinefelter syndrome	5
Borderline intellectual disability with infertility due to Klinefelter syndrome	5
Mild intellectual disability due to Klinefelter syndrome	5
Mild intellectual disability with infertility due to Klinefelter syndrome	5
Primary infertility due to Klinefelter syndrome	5
Chromosomal unbalanced rearrangements	4
Asymptomatic chromosomal unbalanced rearrangements	5
Intellectual disability due to chromosomal unbalanced rearrangements	5
Intellectual disability with congenital heart disease due to chromosomal unbalanced rearrangements	5
Intellectual disability with dementia due to chromosomal unbalanced rearrangements	5
Intellectual disability with congenital heart disease and dementia due to chromosomal unbalanced rearrangements	5
Isolated congenital heart disease due to chromosomal unbalanced rearrangements	5
Other congenital anomalies	4
Mild hearing loss due to other congenital anomalies	5
Mild hearing loss with ringing due to other congenital anomalies	5
Moderate hearing loss due to other congenital anomalies	5
Moderate hearing loss with ringing due to other congenital anomalies	5
Moderately severe hearing loss due to other congenital anomalies	5
Moderately severe hearing loss with ringing due to other congenital anomalies	5
Severe hearing loss with ringing due to other congenital anomalies	5
Severe hearing loss due to other congenital anomalies	5
Profound hearing loss due to other congenital anomalies	5
Profound hearing loss with ringing due to other congenital anomalies	5
Complete hearing loss due to other congenital anomalies	5
Complete hearing loss with ringing due to other congenital anomalies	5
Other congenital anomalies	5
Skin and subcutaneous diseases	3
Dermatitis	4
Mild eczema	5
Moderate eczema	5
Severe eczema	5
Asymptomatic contact dermatitis	5
Mild contact dermatitis	5
Severe contact dermatitis	5
Asymptomatic seborrhoeic dermatitis	5
Symptomatic seborrhoeic dermatitis	5
Psoriasis	4
Mild psoriasis	5
Moderate psoriasis	5
Severe psoriasis	5
Cellulitis	4

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Mild cellulitis	5
Severe cellulitis	5
Pyoderma	4
Impetigo	5
Abscess and other bacterial skin diseases	5
Scabies	4
Fungal skin diseases	4
Tinea capitis	5
Other fungal skin diseases	5
Viral skin diseases	4
Mild molluscum contagiosum	5
Severe molluscum contagiosum	5
Mild viral warts	5
Severe viral warts	5
Acne vulgaris	4
Alopecia areata	4
Mild alopecia areata	5
Severe alopecia areata	5
Pruritus	4
Urticaria	4
Mild urticaria	5
Severe urticaria	5
Decubitus ulcer	4
Mild decubitus ulcer	5
Moderate decubitus ulcer	5
Severe decubitus ulcer	5
Other skin and subcutaneous diseases	4
Asymptomatic other skin and subcutaneous diseases	5
Symptomatic other skin and subcutaneous diseases	5
Sense organ diseases	3
Glaucoma	4
Moderate vision impairment due to glaucoma	5
Severe vision impairment due to glaucoma	5
Blindness due to glaucoma	5
Cataract	4
Moderate vision impairment due to cataract	5
Severe vision impairment due to cataract	5
Blindness due to cataract	5
Macular degeneration	4
Moderate vision impairment due to macular degeneration	5
Severe vision impairment due to macular degeneration	5
Blindness due to macular degeneration	5
Uncorrected refractive error	4
Moderate vision impairment due to uncorrected refractive error	5
Severe vision impairment due to uncorrected refractive error	5
Blindness due to uncorrected refractive error	5
Near vision impairment due to presbyopia due to uncorrected refractive error	5
Age-related and other hearing loss	4
Mild hearing loss due to age-related and other hearing loss	5
Mild hearing loss with ringing due to age-related and other hearing loss	5
Moderate hearing loss due to age-related and other hearing loss	5
Moderate hearing loss with ringing due to age-related and other hearing loss	5
Moderately severe hearing loss due to age-related and other hearing loss	5

Appendix Table A.1: GBD 2013 cause and sequelae list

All causes	Cause level
Moderately severe hearing loss with ringing due to age-related and other hearing loss	5
Severe hearing loss with ringing due to age-related and other hearing loss	5
Severe hearing loss due to age-related and other hearing loss	5
Profound hearing loss due to age-related and other hearing loss	5
Profound hearing loss with ringing due to age-related and other hearing loss	5
Complete hearing loss due to age-related and other hearing loss	5
Complete hearing loss with ringing due to age-related and other hearing loss	5
Other vision loss	4
Moderate vision impairment due to other vision loss	5
Severe vision impairment due to other vision loss	5
Blindness due to other vision loss	5
Other sense organ diseases	4
Asymptomatic other sense organ diseases	5
Mild other sense organ diseases	5
Moderate other sense organ diseases	5
Severe other sense organ diseases	5
Oral disorders	3
Deciduous caries	4
Asymptomatic deciduous caries	5
Tooth pain due to deciduous caries	5
Permanent caries	4
Asymptomatic permanent caries	5
Tooth pain due to permanent caries	5
Periodontal diseases	4
Edentulism and severe tooth loss	4
Asymptomatic edentulism and severe tooth loss	5
Difficulty eating due to edentulism and severe tooth loss	5
Other oral disorders	4
Mild other oral disorders	5
Severe other oral disorders	5

Appendix Table A.2: List of International Classification of Diseases codes mapped to the Global Burden of Disease cause list for causes of disability

Cause Name	ICD-10 Code	ICD-9 Code
	A00-A00.9, A01.0-A14, A15-A28.9, A30-A31.0, A31.8-A39.9, A42-A44.9, A48.1, A48.2, A48.4-A48.52, A49.1, A50-A60.9, A63-A63.8, A65-A71.9, A74-A75.9, A77-A96.9, A98-A98.8, B00-B06.9, B10-B10.89, B15-B17.2, B19.1-B19.21, B20-B27.99, B29.4, B33-B33.8, B37-B37.2, B37.5-B54.0, B55.0-B55.2, B56-B60.8, B63, B65-B81.8, B83-B83.8, B90-B92, B94.0-B94.2, B95-B95.5, D50-D52.0, D52.8-D53.9, D62-D63.8, D64.1-D64.3, D64.8-D64.9, D69.9, D84, D84.9, E00-E02, E40-E46.9, E50-E61.9, E63-E64.9, F07.1, G00.0-G00.8, G03-G03.8, G04-G05.8, G14, G14.6, H65-H75.83, I00, I02, I02.9, I00-106.9, I09-J15.8, I16, I16.9, I20-I21.9, I36, I36.0, K67.0-K67.8, K74.7, K74.8, K93.0, M03.1, M12.1, M12.19, M49.0, M49.1, M73.0, M73.1, M89.6-M89.69, N70-N71.9, N73-N74.8, N96, O00-O07.9, O10-O16.9, O20-O20.9, O23-O23.93, O43.2-O43.239, O44-O46.93, O64-O67.9, O71-O72.3, O85-O86.89, O91-O91.23, P00-P03.1, P03.6-P05.9, P07-P15.9, P19-P29.9, P35-P39.9, P50-P61.9, P70, P70.3-P72.9, P74-P78.9, P80-P81.9, P83-P84, P90-P94.9, P96, P96.3, P96.4, P96.8-P96.89, R19.7, Z03.0, Z03.7-Z03.79, Z11-Z11.9, Z13.2-Z13.3, Z16-Z16.39, Z20-Z21, Z22-Z23.0, Z23.2-Z23.7, Z24.0-Z24.6, Z25.0, Z25.1, Z26.0, Z83.0, Z83.1, Z87.5-Z87.6	001-001.9, 002.0-034.9, 036-036.40, 036.5, 036.8-037.9, 039-039.4, 039.8-040, 040.1-041.89, 042-066.9, 070.0-070.21, 070.3-070.31, 070.41-070.43, 070.51-070.53, 070.7-070.71, 071-076.9, 078.5-084.9, 085.0-085.5, 086-088.9, 090-104.9, 112, 112.0, 112.3-118.9, 120-131.9, 136-136.5, 137-139.1, 139.9, 244.2, 260-269.9, 279.2, 279.3, 279.8-281.9, 285-285.9, 320.0-320.89, 321-323.9, 357.0, 381-384.9, 390-390.9, 391.4, 392, 392.9, 460-469, 470.0, 475-475.9, 476.9, 480-482.89, 483.0-483.9, 484.0-484.7, 487-489, 614-614.9, 630-636.92, 638-638.92, 640-642.94, 646.3-646.33, 659.3-659.33, 660-660.93, 665-665.34, 666-666.9, 670-670.9, 716.0-716.09, 730.4-730.99, 760-760.70, 760.72-768, 768.2-770, 770.1-775, 775.4-779.34, 779.6-779.89, 787.91, V01-V02.9, V03.0-V03.82, V03.9-V06, V07, V07.0, V07.2, V07.3, V08-V09.91, V12.00-V12.1, V12.61, V13.7, V15.87, V18.2, V18.3, V18.8, V58.62, V73.0-V73.99, V74.0-V74.3, V74.5-V74.9, V75.0-V75.9, V77.2, V78.0, V78.1
Communicable, maternal, neonatal, and nutritional diseases		
HIV/AIDS and tuberculosis	A10-A14, A15-A19.9, B20-B24.9, B90-B90.9, D84, D84.9, K67.3, K93.0, M49.0, P37.0, Z03.0, Z11.1, Z11.4, Z20.1, Z20.6, Z21, Z22.6, Z23.2, Z83.0	010-019.9, 042-044.9, 112.4-118.9, 136.3-136.5, 137-137.9, 138.0, 138.9, 139.9, 279.2, 279.3, 279.8, 279.9, 320.4, 730.4-730.6, V01.1, V03.2, V08, V12.01, V74.1
Tuberculosis	A10-A14, A15-A19.9, B90-B90.9, K67.3, K93.0, M49.0, P37.0, Z03.0, Z11.1, Z20.1, Z23.2	010-019.9, 137-137.9, 138.0, 138.9, 139.9, 320.4, 730.4-730.6, V01.1, V03.2, V12.01, V74.1
HIV/AIDS	B20-B24.9, D84, D84.9, Z11.4, Z20.6, Z21, Z22.6, Z83.0	042-044.9, 112.4-118.9, 136.3-136.5, 279.2, 279.3, 279.8, 279.9, V08
HIV/AIDS resulting in mycobacterial infection	B20.0	
HIV/AIDS resulting in other diseases	B20.1-B23.9	042.0-042.9, 043.0-043.9, 044.1-044.9
Diarrhea, lower respiratory, and other common infectious diseases		
Diarrheal diseases	A00-A00.9, A01.0-A09.9, A33-A37.91, A39-A39.9, A83-A87.9, B01-B02.9, B05-B05.9, B94.1, F07.1, G00.0, G00.8, G03-G03.8, G04-G05.8, H65-H75.83, J00-J02, J02.8-J03, J03.8-J06.9, J09-J15.8, J16-J16.9, J20-J21.9, J36, J36.0, P23-P23.9, P35.8, R19.7, Z11.0, Z20.0-Z20.09, Z20.811, Z20.820, Z22.0-Z22.2, Z22.31, Z23.0, Z23.5-Z23.7, Z24.1, Z24.4, Z25.1	001-001.9, 002.0-009.9, 032-033.9, 036-036.40, 036.5, 036.8-037.9, 047-049.9, 052-053.9, 055-055.9, 062-064.9, 139.0, 320.0-320.3, 320.5-320.89, 321-321.4, 321.6-323.9, 381-384.9, 460-469, 470.0, 475-475.9, 476.9, 480-482.89, 483.0-483.9, 484.0-484.3, 484.6, 484.7, 487-489, 771.3, 787.91, V01.0, V01.71, V01.79, V01.82-V01.84, V02.0-V02.4, V03.0, V03.1, V03.5-V03.7, V03.81, V03.82, V04.2, V04.7, V04.81, V04.82, V05.0, V05.1, V05.4, V12.61, V73.2, V74.0, V74.3
Cholera	A00-A00.9, Z23.0	001-001.9, 003-006.9, 007.4-007.8, 008.01, 008.02, 008.04, 008.2-009.9, 787.91, V01.0, V01.83, V02.0, V02.2, V02.3, V03.0, V74.0
Other salmonella infections	A02-A02.9	001-001.9, V01.0, V02.0, V03.0, V74.0
Shigellosis	A03-A03.9	003-003.9
Enteropathogenic E coli infection	A04.0	004-004.9
Enterotoxigenic E coli infection	A04.1	008.01
Campylobacter enteritis	A04.5	008.02, 008.04, V01.83
Amoebiasis	A06-A06.9	008.43
Cryptosporidiosis	A07.2	006-006.9, V02.2
Rotaviral enteritis	A08.0	007.4-007.7
Aeromonas		008.61
Clostridium difficile	A04.7	008.2
Norovirus	A08.1-A08.19	008.45
Adenovirus	A08.2	008.63
Other bacterial foodborne diarrhea	A05-A05.9	008.62
Other diarrheal diseases	A04, A04.3, A04.6, A04.8, A04.9, A07, A07.3, A07.4, A08, A08.3-A09.9, R19.7, Z22.1	005-005.9
Intestinal infectious diseases	A01.0-A01.4, A04.2, A04.4, A07.0, A07.1, A07.8, A07.9, Z11.0, Z20.0-Z20.09, Z22.0	007.8, 008.3-008.42, 008.44, 008.46-008.6, 008.64-009.9, 787.91, V02.3
Typhoid fever	A01.0-A01.09, Z22.0	002.0-002.9, 007-007.3, 007.9-008.00, 008.03, 008.09, 008.1, V02.1, V03.1
Paratyphoid fever	A01.1-A01.4	002.0, V02.1, V03.1
Other intestinal infectious diseases	A04.2, A04.4, A07.0, A07.1, A07.8, A07.9, Z11.0, Z20.0-Z20.09	002.1-002.9
Lower respiratory infections	J09-J15.8, J16-J16.9, J20-J21.9, P23-P23.9, Z25.1	007-007.3, 007.9-008.00, 008.03, 008.09, 008.1
Influenza	J09-J11.89, Z25.1	466-469, 470.0, 480-482.89, 483.0-483.9, 484.1, 484.2, 484.6, 484.7, 487-489, V01.82, V03.81, V03.82, V04.7, V04.81, V04.82, V12.61
Pneumococcal pneumonia	J13, J13.0, J15.3, J15.4, J15.6	487-489, V04.7, V04.81
H influenzae type B pneumonia	J14, J14.0	481-481.9, V03.82
Respiratory syncytial virus pneumonia	J12.1	482.2, V03.81
Other lower respiratory infections	J12, J12.0, J12.2-J12.9, J15-J15.29, J15.5, J15.7, J15.8, J16-J16.9, J20-J21.9, P23-P23.9	480.1, V04.82
Upper respiratory infections	J00-J02, J02.8-J03, J03.8-J06.9, J36, J36.0	466-469, 470.0, 480, 480.0, 480.2-480.9, 482-482.1, 482.3-482.89, 483.0-483.9, 484.1, 484.2, 484.6, 484.7
Otitis media	H65-H75.83	460-465.9, 475-475.9, 476.9
Meningitis	A39-A39.9, A87-A87.9, G00.0-G00.8, G03-G03.8, Z20.811, Z22.31	381-384.9
Pneumococcal meningitis	G00.1	036-036.40, 036.5, 036.8-036.9, 047-049.9, 320.0-320.3, 320.5-320.89, 321-321.4, 321.6-322.9, V01.84
H influenzae type B meningitis	G00.0	047-049.9, 320.2, 320.3, 320.7-320.89, 321-321.4, 321.6-322.9
Meningococcal meningitis	A39-A39.9, Z20.811, Z22.31	062-064.9, 139.0, 323-323.9, V05.0, V05.1
Other meningitis	A87-A87.9, G00.2-G00.8, G03-G03.8	032-032.9, V02.4, V03.5, V74.3
Encephalitis	A83-A86.4, B94.1, F07.1, G04-G05.8, Z24.1	033-033.9, 484.3, V03.6
Diphtheria	A36-A36.9, Z22.2, Z23.6	037-037.9, 771.3, V03.7
Whooping cough	A37-A37.91, Z23.7	055-055.9, 484.0, V04.2, V73.2
Tetanus	A33-A35.0, Z23.5	052-053.9, V01.71, V01.79, V05.4
Measles	B05-B05.9, Z24.4	060-061.8, 065-066.9, 071-071.9, 076-076.1, 076.6, 076.9, 080, 080.2-084.9, 085.0-085.5, 086-088.9, 120-130.9, 139.1, V01.5, V04.4, V04.5, V05.2, V12.03, V73.4-V73.6, V75.1-V75.5, V75.5-V75.8
Varicella and herpes zoster	B01-B02.9, P35.8, Z20.820	
Neglected tropical diseases and malaria	A68-A68.9, A69.2-A69.5, A71-A71.9, A74.0, A75-A75.9, A77-A79.9, A82-A82.9, A90-A96.9, A98-A98.8, B50-B54.0, B55.0-B55.2, B56-B60.8, B65-B81.8, B83-B83.8, B94.0, P37.1, P37.3, P37.4, Z11.6, Z20.3, Z24.2, Z24.3, Z26.0	
Malaria	B50-B54.0, P37.3, P37.4	084-084.9, V12.03, V75.1
Chagas disease	B57-B57.5	086-086.2, 086.9, V75.3
Leishmaniasis	B55.0-B55.2, Z26.0	085.0-085.5, V05.2, V75.2
Visceral leishmaniasis	B55.0	085.0
Cutaneous and mucocutaneous leishmaniasis	B55.1, B55.2, Z26.0	085.1-085.5
African trypanosomiasis	B56-B56.9	086.3-086.5
Schistosomiasis	B65-B65.9	120-120.9, V75.5
Cysticercosis	B69-B69.9	123.1
Cystic echinococcosis	B67-B67.99	122-122.9
Lymphatic filariasis	B74-B74.2	125.0-125.2, V75.6
Onchocerciasis	B73-B73.1	125.3
Trachoma	A71-A71.9, A74.0, B94.0	076-076.1, 076.6, 076.9, 139.1, V73.6
Dengue	A90-A91.9	061-061.8
Yellow fever	A95-A95.9, Z24.3	060-060.9, V04.4, V73.4
Rabies	A82-A82.9, Z20.3, Z24.2	071-071.9, V01.5, V04.5
Intestinal nematode infections	B76-B77.9, B79, Z11.6	126-126.9, 127.0, 127.3, V75.7
Ascariasis	B77-B77.9	127.0
Trichuriasis	B79	127.3
Hookworm disease	B76-B76.9	126-126.9
Food-borne trematodiasis	B66-B66.9	121-121.9
Other neglected tropical diseases	A68-A68.9, A69.2-A69.5, A75-A75.9, A77-A79.9, A92-A94.0, A96-A96.9, A98-A98.8, B58-B60.8, B68-B68.9, B70-B72.0, B74.3-B75, B78-B78.9, B80-B81.8, B83-B83.8, P37.1	065-066.9, 080, 080.2-083.9, 087-088.9, 123, 123.0, 123.2-125, 125.4-125.9, 127, 127.1, 127.2, 127.4-130.9, V73.5
Maternal disorders	N96, O00-O07.9, O10-O16.9, O20-O20.9, O23-O23.93, O43.2-O43.239, O44-O46.93, O64-O67.9, O71-O72.3, O85-O86.89, O91-O91.23, Z03.7-Z03.79, Z87.5-Z87.6	630-636.92, 638-638.92, 640-642.94, 646.3-646.33, 659.3-659.33, 660-660.93, 665-665.34, 666-666.9, 670-670.9
Maternal hemorrhage	O20-O20.9, O43.2-O43.239, O44-O46.93, O67-O67.9, O71-O71.4, O72-O72.3	640-641.93, 665-665.34, 666-666.9
Maternal sepsis and other maternal infections	O23-O23.93, O85-O86.89, O91-O91.23	659.3-659.33, 670-670.9

Appendix Table A.2: List of International Classification of Diseases codes mapped to the Global Burden of Disease cause list for causes of disability			
Cause Name	ICD-10 Code	ICD-9 Code	
Maternal hypertensive disorders	O10-O16.9	642-642.94	
Obstructed labor	O64-O66.9, O71.5-O71.9	660-660.93	
Complications of abortion	N96, O00-O07.9	630-636.92, 638-638.92, 646.3-646.33	
Indirect maternal deaths			
Late maternal deaths			
Maternal deaths aggravated by HIV/AIDS			
Other maternal disorders	P00-P03.1, P03.6-P05.9, P07-P15.9, P19-P22.9, P24-P29.9, P36-P36.9, P38-P39.9, P50-P61.9, P70, P70.3-P72.9, P74-P78.9, P80-P81.9, P83-P84, P90-P94.9, P96, P96.3, P96.4, P96.8-P96.89	760-760.70, 760.72-768, 768.2-770, 770.1-771, 771.4-775, 775.4-779.34, 779.6-779.89, V13.7, V15.87	
Neonatal disorders			
Preterm birth complications	P01.0, P01.1, P07-P07.39, P22-P22.9, P25-P28.9, P61.2, P77-P77.9	761.0, 761.1, 765-765.9, 769-769.9, 770.2-770.9, 776.6, 777.5-777.6	
Neonatal encephalopathy due to birth asphyxia and trauma	P01.7-P03.1, P03.6-P03.9, P10-P15.9, P20, P21, P24-P24.9, P90-P91.9	761.7-763.9, 767-768, 768.2-768.9, 770.1-770.18, 772.1-772.9, 779.0-779.2	
Neonatal sepsis and other neonatal infections	P36-P36.9, P38-P39.9	771.4-771.9	
Hemolytic disease and other neonatal jaundice	P55-P59.9	773-774.9	
Other neonatal disorders	P00-P01, P01.2-P01.6, P04-P05.9, P08-P09, P19-P19.9, P20-P20.9, P21.0-P21.9, P29-P29.9, P50-P54.9, P60-P61.1, P61.3-P61.9, P70, P70.3-P72.9, P74-P76.9, P78-P78.9, P80-P81.9, P83-P84, P92-P94.9, P96, P96.3, P96.4, P96.8-P96.89	760-760.70, 760.72-761, 761.2-761.6, 764-764.99, 766-766.9, 770, 771, 772, 772.0, 775, 775.4-776.5, 776.7-777.4, 777.7-779, 779.3-779.34, 779.6-779.89	
Nutritional deficiencies	D50-D52.0, D52.8-D53.9, D62-D63.8, D64.1-D64.3, D64.8-D64.9, D69.9, E00-E02, E40-E46.9, E50-E61.9, E63-E64.9, M12.1-M12.19, Z13.2-Z13.3	244.2, 260-269.9, 280-281.9, 285-285.9, 716.0-716.09, V12.1, V18.2, V18.3, V77.2, V78.0, V78.1	
Protein-energy malnutrition	E40-E46.9, E64.0	260-263.9	
Iodine deficiency	E00-E02	244.2	
Vitamin A deficiency	E50-E50.9, E64.1	264-264.9	
Iron-deficiency anemia	D50-D50.9, D62-D63.8, D64.1-D64.3, D64.8-D64.9, D69.9	280-281, 285-285.9, V18.2, V18.3, V78.0, V78.1	
Other nutritional deficiencies	D51-D52.0, D52.8-D53.9, E51-E61.9, E63-E64, E64.2, E64.3, M12.1-M12.19, Z13.2-Z13.3	265-269.9, 281.0-281.9, 716.0-716.09	
Other communicable, maternal, neonatal, and nutritional diseases	A20-A28.9, A30-A31.0, A31.8-A32.9, A38-A38.9, A42-A44.9, A48.1, A48.2, A48.4-A48.52, A49.1, A50-A60.9, A63-A63.8, A65-A67.9, A69-A69.1, A69.8-A70, A74, A74.8-A74.9, A80-A81.9, A88-A89.9, B00-B00.9, B03, B04, B06-B06.9, B10-B10.89, B15-B17.2, B19.1-B19.21, B25-B27.99, B29.4, B33-B33.8, B37-B37.2, B37.5-B49.9, B63, B91, B92, B94.2, B95-B95.5, G14, G14.6, I00, I02, I02.9, J02.0, J03.0-J03.01, K67.0, K67.2, K67.8, K74.7, K74.8, M03.1, M49.1, M73.0, M73.1, M89.6-M89.69, N70-N71.9, N73-N74.8, P35-P35.3, P35.9, P37, P37.2, P37.5-P37.9, Z11.3, Z20.2, Z20.4, Z20.5, Z20.810, Z22.4-Z22.59, Z22.8, Z22.9, Z23.3, Z23.4, Z24.0, Z24.5, Z24.6, Z25.0	020-031.9, 034-034.9, 039-039.4, 039.8-040, 040.1-041.89, 045-046.9, 050-051.9, 054-054.9, 056-059.9, 070-070.21, 070.3-070.31, 070.41-070.43, 070.51-070.53, 070.7-070.71, 072-075.9, 075.0, 076.8, 078.5-079.9, 080.0, 090-104.9, 112, 112.0, 112.3, 131-131.9, 136-136.29, 138, 139, 321.5, 357.0, 390-390.9, 379.4, 392, 392.9, 484.4, 484.5, 614-614.9, 730.7-730.99, 771.0-771.2, V01.2-V01.4, V01.6, V01.7, V01.8, V01.81, V01.89, V02.51-V02.9, V03.3, V03.4, V03.8, V03.9-V04.1, V04.3, V04.6, V04.8, V04.89, V05, V05.3, V05.8-V06, V12.00, V12.02, V12.09, V73.0, V73.1, V73.3, V73.8, V73.88, V73.9, V73.98, V74.2, V74.5, V74.6	
Sexually transmitted diseases excluding HIV	A50-A60.9, A63-A63.8, B63, K67.0-K67.2, M03.1, M73.0, M73.1, N70-N71.9, N73-N74.8, Z11.3, Z20.2, Z24	054.1, 090-099.9, 131-131.9, 614-614.9, V01.6, V02.7-V02.9, V73.8, V73.88, V73.9, V73.98, V74.5, V74.6	
Syphilis	A50-A53.9, K67.2, M03.1, M73.1	090-097.9	
Chlamydial infection	A55-A56.8, K67.0	099, 099.1, 099.3-099.6, V73.8, V73.88, V73.9, V73.98	
Gonococcal infection	A54-A54.9, K67.1, M73.0	098-098.9, V02.7	
Trichomoniasis	A59-A59.9	131-131.9	
Genital herpes	A60-A60.9	054.1	
Other sexually transmitted diseases	A57-A58, A63-A63.8	099.0, 099.2, 099.8, 099.9	
Hepatitis	B15-B17.2, B19.1-B19.21, B94.2, P35.3, Z20.5, Z22.5-Z22.59, Z24.6	070.0-070.21, 070.3-070.31, 070.41-070.43, 070.51-070.53, 070.7-070.71, V02.6-V02.69, V05.3	
Acute hepatitis A	B15-B15.9	070.0, 070.1	
Acute hepatitis B	B16-B17.0, B19.1-B19.11, P35.3	070.2-070.21, 070.3-070.31, 070.42, 070.52, V02.61	
Acute hepatitis C	B17.1-B17.11, B19.2-B19.21	070.41, 070.51, 070.7-070.71, V02.62	
Acute hepatitis E	B17.2	070.43, 070.53	
Leptosy	A30-A30.9, B92	030-030.9, V74.2	
Other infectious diseases	A20-A28.9, A31, A31.0, A31.8-A32.9, A38-A38.9, A42-A44.9, A48.1, A48.2, A48.4-A48.52, A49.1, A65-A67.9, A69-A69.1, A69.8-A70, A74, A74.8-A74.9, A80-A81.9, A88-A89.9, B00-B00.9, B03, B04, B06-B06.9, B10-B10.89, B25-B27.99, B29.4, B33-B33.8, B37-B37.2, B37.5-B49.9, B91, B95-B95.5, G14, G14.6, I00, I02, I02.9, J02.0, J03.0-J03.01, K67.8, K74.7, K74.8, M49.1, M89.6-M89.69, P35-P35.2, P35.9, P37, P37.2, P37.5-P37.9, Z20.4, Z20.810, Z22.8, Z22.9, Z23.3, Z23.4, Z24.0, Z24.5, Z25.0	020-029, 031-031.9, 034-034.9, 039-039.4, 039.8-040, 040.1-041.89, 045-046.9, 050-051.9, 054, 054.0, 054.10-054.9, 056-059.9, 072-075.9, 076.5, 076.8, 078.5-079.9, 080.0, 100-104.9, 112, 112.0, 112.3, 136-136.29, 138, 139, 321.5, 357.0, 390-390.9, 391.4, 392, 392.9, 484.4, 484.5, 730.7-730.99, 771.0-771.2, V01.2-V01.4, V01.7, V01.8, V01.81, V01.89, V02.51-V02.59, V03.3, V03.4, V03.8, V03.9-V04.1, V04.3, V04.6, V04.8, V04.89, V05, V05.8-V06, V12.00, V12.02, V12.09, V73.0, V73.1, V73.3, V73.8, V73.88, V73.9, V73.98, V74.2, V74.5, V74.6

233.0-233.2, 233.31, 233.32, 233.4, 233.5, 233.7, 234.0-234.8, 235.0, 235.4, 235.6-235.8, 236.1, 236.2, 236.4, 236.5, 236.7, 236.91-237.9, 238.0-238.8, 239.2-239.4, 239.6, 240-243.9, 244.0, 244.1, 244.3, 244.8, 245-246.9, 250-259.9, 270-276, 277-277.2, 277.30-277.9, 278.0-279.19, 279.4-279.6, 282-284.9, 286-286.5, 286.7-292.9, 294.1-296.99, 298-298.4, 299-300.15, 300.2-300.89, 301-301.89, 302-303.93, 304.0-304.83, 305-306.9, 307.0-307.49, 307.51, 307.54, 307.6, 307.7, 307.81, 308-309.9, 311-313.83, 314-314.2, 315-315.5, 317-319.9, 327-327.09, 327.3-327.8, 330-331.2, 331.5-339.12, 339.20-341.9, 345-347.9, 349-349.8, 350-356.9, 357.1-357.7, 358-360.44, 360.8-366.19, 366.3-374.85, 374.87-376.52, 376.8-380.9, 385-385.82, 385.89-389.9, 391-391.2, 391.8, 391.9, 392.0, 393-398.99, 402-404.93, 410-414.9, 416.1, 416.2, 417-417.9, 420-423, 423.1-425.9, 427-427.32, 427.4-427.89, 429.0, 429.1, 430-435.9, 437.0-437.2, 437.5-437.8, 442-457.9, 459, 459.1-459.39, 470, 470.9-474.9, 476-476.1, 477-479, 490-504.9, 506-506.9, 508-509.515, 516-517.8, 518.6, 518.7, 518.9, 519.0-519.8, 520-526.1, 536.4-536.49, 537-537.6, 537.8-537.84, 538-539.4, 550-553.5, 555-558.9, 560-560.39, 560.8-560.9, 562-562.13, 564-564.7, 565-566.9, 569.0-569.44, 569.5-569.71, 569.84, 569.85, 571-571.9, 572.3-572.29, 573.0-573.4, 573.8-577.9, 579-583.9, 585-585.9, 588-590.9, 592-593.89, 594-599.6, 599.8-599.89, 600-608.89, 610-612.1, 615-618.9, 620-620.9, 621.0-622.7, 623-624.9, 625.4, 627-629.81, 680-709.3, 709.8-712.99, 713.0-713.5, 714-714.33, 714.8-715.98, 716.2-716.39, 717-718.99, 719.2-719.39, 719.8-719.89, 720-721.6, 721.8-728.11, 728.13-728.81, 728.83-729.5, 729.7-729.99, 729.92-730.39, 731-734.2, 737-737.9, 739-758.9, 759.0-759.89, 760.71, 775.0-775.3, 779.4, 779.5, 780.5-780.52, 780.57, 780.59, 780.62, 780.63, 786.03, 787.1, 788.0, 788.3-788.39, 790.2-790.22, 790.3, 885.0, 885.029, 885.09, 885.439, 886.0-E86.019, V07.1, V07.31-V07.59, V10-V12.0, V12.2-V12.6, V12.69, V12.79, V13.0-V13.09, V13.2, V13.22-V13.69, V13.81, V14-V15.1, V15.8-V15.86, V16-V16.19, V18.4-V18.7, V19.9, V19.0-V19.8, V26-V26.9, V40-V41.9, V42.0-V42.9, V42.81, V42.83, V43.0-V43.83, V44-V45.4, V45.6-V45.89, V47.2-V47.5, V48.4, V48.5, V49.81, V50.3, V56-V56.8, V58.5, V58.61, V58.63-V58.67, V58.71, V58.78, V59.1-V59.74, V72, V72.2, V73.2, V74.4, V76-V76.9, V77.0, V77.1, V77.3-V77.8, V77.91, V78, V78.2, V80.0, V80.09-V81.6, V82.0-V82.3, V85-V85.54	
Non-communicable diseases	C00-C13.9, C15-C25.9, C30-C34.92, C37-C38.8, C40-C41.9, C43-C45.9, C47-C54.9, C56-C57.8, C58, C58.0, C60-C63.8, C64-C67.9, C68.0-C68.8, C69-C75.8, C81-C86.6, C88-C97.9, D00.0-D00.2, D01.0-D01.3, D02.0, D03-D06.9, D07.0-D07.2, D07.4, D07.5, D09.0, D09.2-D09.8, D10.0-D10.7, D11-D12.9, D13.0, D13.1, D14.0-D14.32, D15-D25.9, D26.0, D26.1, D27-D27.9, D28.0-D28.7, D29.0-D29.8, D30.0-D30.8, D31-D36.7, D37.0-D37.5, D38.0-D38.5, D39.1-D39.8, D40.0-D40.8, D41.0-D41.8, D42-D43.9, D44.0-D44.8, D45-D47.9, D48.0-D48.7, D49.2-D49.4, D49.6, D49.81, K31.7, K62.0, K62.1, K63.5, N60-N60.99, N84.0-N84.8, N87-N87.9, Z03.1, Z08-Z09.9, Z12-Z12.9, Z80-Z80.9, Z85-Z85.9, Z86.0-Z86.03	140-148.9, 150-158.9, 160-164.9, 170-175.9, 180-183.8, 184.0-184.4, 184.8, 185-186.9, 187.1-187.8, 188-188.9, 189.0-189.8, 190-194.8, 200-208.92, 209.0-209.17, 209.31-209.57, 209.61, 209.63-209.67, 210.0-210.9, 211.0-211.8, 212.0-212.8, 213-218.9, 219.0, 219.1, 221.0-221.8, 222.0-222.8, 223.0-223.89, 224-228.9, 229.0, 229.8, 230.1-230.8, 231.0-231.2, 232-232.9, 233.0-233.2, 233.31, 233.32, 233.4, 233.5, 233.7, 234.0-234.8, 235.0, 235.4, 235.6-235.8, 236.1, 236.2, 236.4, 236.5, 236.7, 236.91-237.9, 238.0-238.8, 239.2-239.4, 239.6, 240-243.9, 244.0, 244.1, 244.3, 244.8, 245-246.9, 250-259.9, 270-276, 277-277.2, 277.30-277.9, 278.0-279.19, 279.4-279.6, 282-284.9, 286-286.5, 286.7-292.9, 294.1-296.99, 298-298.4, 299-300.15, 300.2-300.89, 301-301.89, 302-303.93, 304.0-304.83, 305-306.9, 307.0-3	

Appendix Table A.2: List of International Classification of Diseases codes mapped to the Global Burden of Disease cause list for causes of disability

Cause Name	ICD-10 Code	ICD-9 Code
Breast cancer	C50-C50.119, C50.2-C50.929, Z12.3-Z12.39, Z80.3, Z85.3	174-175.9, V10.3, V16.3, V76.1-V76.19
Cervical cancer	C53-C53.9, Z12.4, Z85.41	180-180.9, V10.4.1, V72.32, V76.2
Uterine cancer	C54-C54.9, Z85.42	182-182.8, V10.4.2
Prostate cancer	C61-C61.9, Z12.5, Z80.42, Z85.46	185-185.9, V10.4.6, V16.4.2, V76.4.4
Colon and rectum cancer	C18-C20.0, C20.9-C21.8, K63.5, Z12.1-Z12.13, Z85.03-Z85.04.8, Z86.010	153-154.9, 155.5, 155.9, 209.1-209.17, V10.05, V10.06, V76.41, V76.5-V76.52
Lip and oral cavity cancer	C00-C08.9, Z85.81, Z85.810	140-145.9, V10.01, V10.02, V76.4.2
Nasopharynx cancer	C11-C11.9	147-147.9
Other pharynx cancer	C09-C10.9, C12-C13.9	146-146.9, 148-148.9
Gallbladder and biliary tract cancer	C20.8, C23-C24.9	156-156.9, 209.25-209.27
Pancreatic cancer	C25-C25.9, Z85.07	157-157.9
Malignant skin melanoma	C43-C43.9, C44, Z85.72, Z85.82-Z85.82.8	172-172.9
Non-melanoma skin cancer	C44-C44.99	173-173.99, 209.31-209.36, V76.4.3
Ovarian cancer	C56-C56.9, Z80.41, Z85.43	183, 183.0, V10.4.3, V16.4.1, V76.4.6
Testicular cancer	C62-C62.92, Z80.43, Z85.47, Z85.48	186-186.9, V10.4.7, V10.4.8, V16.4.3, V76.4.5
Kidney cancer	C64-C65.9, Z80.51, Z85.52-Z85.54	189.0, 189.1, 209.24, V10.5.2, V10.5.3, V16.5.1
Bladder cancer	C67-C67.9, Z12.6-Z12.7.9, Z80.52, Z85.51	188-188.9, V10.5.1, V16.5.2, V76.3
Brain and nervous system cancer	C70-C72.9, Z85.84.1, Z85.84.8	191-192.9, V10.8.5, V10.8.6
Thyroid cancer	C73-C73.9, Z85.85.0	193-193.9, V10.8.7
Mesotheliom	C45-C45.9	163-163.3, 163.8, 163.9
Hodgkin lymphoma	C81-C81.99, Z85.71	201-201.98, V10.7.2
Non-Hodgkin lymphoma	C82-C86.6, C96-C97.9, D36.0, D47.0-D47.2, D47.9	200-200.9, 202-202.98, V10.7, V10.7.1, V10.7.9, V16.7
Multiple myeloma	C88-C90.32	203-203.9
Leukemia	C91-C95.92, Z80.6, Z85.6	204-208.92, V10.59-V10.69, V16.6
Other neoplasms	C17-C17.9, C30-C31.9, C37-C38.8, C40-C41.9, C47-C49.9, C50.12-C50.12.9, C51-C52.9, C57-C57.8, C58, C58.0, C60-C60.9, C63-C63.8, C66-C66.9, C68.0-C68.8, C69-C69.92, C74-C75.8, D00.00-D00.2, D01.0-D01.3, D02.0-D02.3, D03-D06.9, D07.0-D07.2, D07.4, D07.5, D09.0, D09.2-D09.8, D10.0-D10.7, D11-D12.9, D13.0-D13.7, D14.0-D14.32, D15-D25.9, D26.0, D26.1, D27-D27.9, D28.0-D28.7, D29.0-D29.8, D30.0-D30.8, D31-D36, D36.1-D36.7, D37.01-D37.5, D38.0-D38.5, D39.1-D39.8, D40.0-D40.8, D41.0-D41.8, D42-D43.9, D44.0-D44.8, D45-D47, D47.3-D47.7, D48.0-D48.7, D49.2-D49.4, D49.6, D49.8.1, K31.7, K62.0, K62.1, N60-N60.99, N84.0-N84.8, N87-N87.9, Z12.8-Z12.9, Z85.06-Z85.06.8, Z85.22-Z85.29, Z85.83-Z85.84.0, Z86.00.0, Z86.01.1, Z86.01.1	036.41-036.43, 036.6, 391-391.2, 391.8, 391.9, 392.0, 393-398.99, 402-402.91, 410-414.9, 417-417.9, 420-423, 423.1-425.9, 427-427.32, 427.6-427.89, 429.0, 429.1, 430-435.9, 437.0-437.2, 437.5-437.8, 442-445.89, 447-454.9, 456, 456.3-457.9, 459, 459.1-459.39, V12.5-V12.5.9, V15.1, V17.1, V17.3-V17.49, V42.1, V42.2, V43.2-V43.5, V45.0-V45.0.9, V45.81, V45.82, V47.2, V58.61, V58.63, V58.66, V58.73, V81.3, V81.2
Cardiovascular diseases		
Rheumatic heart disease	I01-I01.9, I02.0, I05-I09.9	391-391.2, 391.8, 391.9, 392.0, 393-398.99
Ischemic heart disease	I20-I25.9, Z82.4-Z82.4.9	410-414.9, V17.3
Cerebrovascular disease	G45-G46.8, I60-I61.9, I62.0-I62.03, I63-I63.9, I64.0-I66.9, I67.0-I67.3, I67.5-I67.7, I69.0-I69.198, I69.20-I69.398, Z82.3	430-435.9, 437.0-437.2, 437.5-437.8, V12.54, V17.1
Ischemic stroke	G45-G46.8, I63-I63.9, I64.0-I66.9, I67.2, I67.3, I67.5, I67.6, I69.3-I69.398	433-435.9, 437.0, 437.1, 437.5-437.8
Hemorrhagic stroke	I60-I61.9, I62.0-I62.03, I67.0, I67.1, I67.7, I69.0-I69.198, I69.20-I69.298	430-432.9, 437.2
Hypertensive heart disease	I11-I11.9	402-402.91
Cardiomyopathy and myocarditis	I40-I42.9, I51.4-I51.6	036.43, 036.6, 422-422.99, 425-425.9, 429.0, 429.1
Atrial fibrillation and flutter	I48-I48.92	427.3-427.32
Aortic aneurysm		
Peripheral vascular disease	I70.2-I70.799, I73-I73.9	443.0-443.9
Endocarditis	I33-I33.9, I39-I39.9	036.42, 421-421.9, 424.9-424.91
Other cardiovascular and circulatory diseases	I28-I28.8, I30-I31.1, I31.8, I31.9, I34-I38.9, I47-I47.9, I51.0-I51.3, I70.8, I72-I72.9, I74-I78.9, I80-I83.93, I86-I89.9, I91.9	036.41, 417-417.9, 420-420.99, 423, 423.1-424.8, 424.99, 427-427.2, 427.6-427.89, 442-443, 444-445.89, 447-454.9, 456, 456.3-457.9, 459, 459.1-459.39
Chronic respiratory diseases	D86-D86.2, D86.89, D86.9, G47.3-G47.39, J30-J35.9, J37-I47.9, J60-J63.8, J65-J68.9, J70-J70.1, J70.8, J70.9, J82, J84-I84.9, J91-J92.9, J98-J98.09, J98.4-J98.6, Z82.5, Z83.6, Z87.0-Z87.0.9, Z94.2	490-492.9, 494-494.9, 496-499
Chronic obstructive pulmonary disease	J40-J44.9, J47-I47.9	490-492.9, 494-494.9, 496-499
Pneumoconiosis	J60-J63.8, J65, J65.0, J92.0	500-504.9, V15.84
Silicosis	J62-J62.9	502-502.9, 503.0, 503.9
Asbestosis	J61, J61.0, J92.0	501, V15.84
Coal workers pneumoconiosis	J60, J60.0	500-500.9, 501.0, 501.9
Other pneumoconiosis	J63-J63.8, J65, J65.0	503, 503.1, 504-504.9
Asthma	J45-J46.9, Z82.5	493-493.92, V17.5
Interstitial lung disease and pulmonary sarcoidosis	D86-D86.2, D86.89, D86.9, J84-I84.9	135-135.9, 136.6, 515, 516-516.9
Other chronic respiratory diseases	G47.3-G47.39, J30-J35.9, J37-I39.9, J66-J68.9, J70-J70.1, J70.8, J70.9, J82, J91-J92.9, J98-J98.09, J98.4-J98.6	327.2-327.8, 470, 470.9-474.9, 476-476.1, 477-479, 495-495.9, 506-506.9, 508-509, 517-517.8, 518.6, 518.9, 519.1-519.8, 713.4, 780.57, 786.03, V07.1, V13.81, V14-V15.09, V19.6
Cirrhosis	B18-B18.9, I85-I85.9, K70-K70.9, K71.3-K71.5.1, K71.7, K72.1-K74.69, K74.9, K75.8-K76.0, K76.6, K76.7, K76.9, Z52.6, Z94.4	070.22, 070.23, 070.32, 070.33, 070.44, 070.54, 456.0-456.21, 571-571.9, 572.3-572.9, 573.0-573.3, 573.8, 573.9, V42.7, V59.6
Cirrhosis due to hepatitis B		
Cirrhosis due to hepatitis C		
Cirrhosis due to alcohol use		
Cirrhosis due to other causes		
Digestive diseases		
Peptic ulcer disease	K25-K28.9, K31, K31.1-K31.6, K31.8, K31.82-K31.89	531-534.91, V12.71
Gastritis and duodenitis	K29-K29.91	535-535.9
Appendicitis	K35-K37.9, K38.3	540-542.9
Paralytic ileus and intestinal obstruction	K56-K56.9	560-560.39, 560.8-560.9
Inguinal, femoral, and abdominal hernia	K40-K42.9, K44-K46.9	550-551.1, 551.3-552.1, 552.3-553.03, 553.6, 555.3
Inflammatory bowel disease	K50-K52.9, K58.0, M09.1	555-555.2, 555.9-556.9, 558-558.9, 569.5, V12.72
Vascular intestinal disorders	K55-K55.9	557-557.9
Gallbladder and biliary diseases	K80-K83.9	574-576.9
Pancreatitis	K85-K86.9	577-577.9, 579.4
Other digestive diseases	I84-I84.9, K00-K01.1, K03-K04.99, K06-K15.9, K20-K22.9, K25-K29.91, K31-K31.6, K31.8-K31.89, K35-K38.9, K40-K42.9, K44-K46.9, K50-K52.9, K55-K57.93, K58.0-K62, K62.2-K62.6, K62.8-K62.9, K64-K64.9, K66.8, K67, K68-K68.9, K75.2-K75.4, K76.1-K76.5, K76.8-K76.8.9, K77-K77.8, K80-K83.9, K85-K86.9, K90-K90.9, K92.8-K92.89, M09.1, R12-R14.3, Z13.81-Z13.81.8, Z43.1-Z43.4, Z83.7-Z83.7.9, Z87.1-Z87.1.9	455-455.9, 530-536.1, 537-537.6, 537.8-537.8.4, 538, 540-543.9, 550-551.1, 551.3-552.1, 552.3-553.6, 555-558.9, 560-560.39, 560.8-560.9, 562-562.13, 564-564.1, 564.5-564.7, 565-566.9, 569.1-569.42, 569.5, 569.7, 569.7.1, 573.4, 574-577.9, 579-579.2, 579.4-579.9, 713.1, 787.1, V12.7-V12.7.9, V18.5-V18.5.9, V45.72, V45.75, V47.3, V58.75
Neurological disorders		
Alzheimer disease and other dementias	F00-F03.91, G30-G31.9	290-290.9, 294.1-294.9, 331-331.2
Parkinson disease	G20-G21.0, G21.2-G22.0	332-332.9
Epilepsy	G40-G41.9, Z82.0	345-345.91
Multiple sclerosis	G35-G35.9	340-340.9
Migraine	G43-G43.919	346-346.93
Tension-type headache	G44-G44.229, G44.8-G44.8.9	307.81, 339-339.12, 339.20-339.89

Appendix Table A.2: List of International Classification of Diseases codes mapped to the Global Burden of Disease cause list for causes of disability

Cause Name	ICD-10 Code	ICD-9 Code
Medication overuse headache	G44.4-G44.59	
Other neurological disorders	G10-G13.8, G23-G24, G24.1-G25.0, G25.2, G25.3, G25.5, G25.8-G26.0, G36-G37.9, G50-G52.9, G54, G54.0, G54.5, G54.8, G54.9, G56-G57, G57.2-G58.7, G60-G62, G62.2, G64, G64.0, G70-G72, G72.2-G73.7, G90-G92.9, G95-G95.9, M33-M33.99, M60-M60.19, M60.8-M63.89, M79-M79.9	330-330.9, 331.5-331.9, 333-338.4, 341-341.9, 349, 349.2-349.8, 350-353.0, 353.5-355, 355.1-356.9, 357.1, 357.3, 357.4, 357.7, 358-359.9, 713.5, 725-725.9, 728-728.11, 728.13-728.81, 728.83-729.5, 729.7-729.90, 729.92, 729.99, 775.2
Mental and substance use disorders	F06.2-F06.7, F10-F13.8, F40-F49, F50.0-F50.5, F51-F52.9, F54-F83, F84.0-F84.8, F89.0-F89.6, F99.0, G47-G47.29, G47.4-G47.9, G62.1, G72.1, P96.1, Q86.0, R43.0, R43.1, R78.0-R78.5, X45-X45.9, X49-X49.9, Z03.2, Z04.6-Z04.72, Z13.4, Z64, Z81.8, Z86.5-Z86.59	291-292.9, 295-296.99, 298-298.4, 299-300.15, 300.2-300.89, 301-301.89, 302-303.93, 304.0-304.83, 305-306.9, 307.0-307.49, 307.51, 307.54, 307.6, 307.7, 308-309.9, 311-313.83, 314-314.2, 315-315.5, 317-319.9, 327-327.09, 347-347.9, 357.5, 760.71, 780.5-780.52, 780.59, 790.3, E85.0-E85.029, E85.09-E85.439, E86.0-E86.019, V11.0-V12.0, V15.8-V15.83, V15.85, V15.86, V17, V17.0, V18.4, V40-V41.9, V79-V79.9
Schizophrenia	F06.2, F20-F23.9, F25-F29.9	295-295.95, 301.0, 301.2-301.22, V11.0
Alcohol use disorders	F10-F10.99, G62.1, G72.1, Q86.0, R78.0, X45-X45.9, Z81.1	291-291.9, 303-303.93, 305.0-305.03, 357.5, 760.71, 790.3, E86.0-E86.019, V11.3
Drug use disorders	F11-F16.99, F18-F19.99, P96.1, R78.1-R78.5, X49-X49.9, Z81.2-Z81.4	292-292.9, 304.0-304.83, 305, 305.1-305.93, E85.0-E85.029, E85.09-E85.439, V15.8-V15.83, V15.85, V15.86
Opioid use disorders	F11-F11.99, P96.1, R78.1	304.0-304.03, 305.5-305.53, E85.00-E85.029
Cocaine use disorders	F14-F14.99, R78.2	304.2-304.23, 305.6-305.63
Amphetamine use disorders	F15-F15.99	304.4-304.43, 305.7-305.73
Cannabis use disorders	F12-F12.99	304.3-304.33, 305.2-305.23
Other drug use disorders	F13-F13.99, F16-F16.99, F18-F19.99, R78.3-R78.5, X49-X49.9	292-292.9, 304.1-304.13, 304.5-304.83, 305, 305.1-305.13, 305.3-305.43, 305.8-305.93, V15.8-V15.83, V15.85, V15.86
Depressive disorders	F32-F33.9, F34.1	296.2-296.36, 300.4, 311-311.9, V11.1, V11.2
Major depressive disorder	F32-F33.9	296.2-296.36, 311-311.9, V11.1, V11.2
Dysthymia	F34.1	300.4
Bipolar disorder	F06.3-F06.34, F30-F31.9, F34.0	296-296.16, 296.4-296.99, 301.1-301.13
Anxiety disorders	F06.4-F06.7, F40-F44.9	300.0-300.09, 300.2-300.3, 301.4, 308-309.9, 313.0
Eating disorders	F50.0-F50.5	307.1, 307.51, 307.54
Anorexia nervosa	F50.0-F50.1	307.1, 307.54
Bulimia nervosa	F50.2-F50.5	307.51
Autistic spectrum disorders	F84.0-F84.8	299.0-299.01, 299.8-299.81
Autism	F84.0-F84.4	299.0-299.01
Asperger syndrome	F84.5, F84.8	299.8-299.81
Attention-deficit/hyperactivity disorder	F90-F90.9	314.0-314.01
Conduct disorder	F91-F94.9	301, 301.3, 301.5-301.89, 312-312.9
Idiopathic intellectual disability	F70-F79.9, Z81.0	317-319.9, V18.4
Other mental and substance use disorders	F17-F17.9, F24, F34, F34.8, F45-F49, F51-F52.9, F54-F69.0, F80-F83, F89.0, F95-F98.6, P99.0, G47-G47.29, G47.4-G47.9, R43.0, R43.1	298-298.4, 299, 299.1-299.11, 299.9-300, 300.1-300.15, 300.5-300.89, 302-302.9, 306-306.9, 307.0, 307.2-307.49, 307.6, 307.7, 313, 313.1-313.83, 314, 314.1, 314.2, 315-315.5, 327-327.09, 347-347.9, 780.5-780.52, 780.59
Diabetes, urogenital, blood, and endocrine diseases	B37.3-B37.49, D52.1, D55-D58.9, D59.0-D59.3, D59.5, D59.6, D60-D61.9, D64.0, D64.4, D66-D69.8, D70-D75.89, D76-D78.89, D80-D83.9, D84.0-D84.8, D86.3-D86.87, D89-D89.9, E03-E07.1, E09-E16.9, E20-E20.8, E36-E36.8, E65-E68, E70-E85.29, E87.71, E88-E89.9, G21.1-G21.19, G24.0-G24.09, G25.1, G25.4, G25.6-G25.79, G62.0, G72.0, G93.7, G97-G97.9, H59-H59.89, H95-H95.9, I12-I13.9, I95.2, I95.3, I97-198.9, J70.2-J70.5, J95-J95.9, K43-K43.9, K62.7, K91-K92, K94-K95.89, L23.3, L24.4, L25.1, L27.0, L27.1, L56, L56.0, L58-L58.9, M10.2-M10.29, M83.5, M87.1-M87.19, M96-M96.9, N00-N08.8, N10-N12.9, N14-N16.8, N18-N18.9, N20-N23.0, N25-N32.0, N32.3, N32.4, N34-N37.8, N39-N39.8, N40-N53.9, N61-N65.1, N72, N72.0, N75-N77.8, N80-N81.9, N83-N83.9, N85-N86, N88-N91.5, N94.3, N95, N95.1-N95.9, N97-N97.9, N99-N99.9, P03.2-P03.5, P70.0-P70.2, P96.2, P96.5, R50.2, R50.82, R50.83, R73-R73.9, Z01.4-Z01.7, Z13.1, Z13.10, Z31-Z31.9, Z42-Z43.0, Z43.5-Z43.9, Z48-Z49.32, Z51-Z51.9, Z52.4, Z83.3-Z83.49, Z84.1, Z84.2, Z86.1-Z86.19, Z87.4-Z87.448, Z88-Z88.9, Z92-Z94.0, Z94.6, Z94.8-Z94.9, Z96-Z96.49, Z96.6-Z97.2	250-250.39, 250.5-250.99, 357.2, 362.0-362.07, 366.41, 775.0, 775.1, 790.2-790.22, V18, V18.0, V42.83, V45.85, V58.67, V77.1
Diabetes mellitus	E10-E10.11, E10.3-E11.1, E11.3-E12.1, E12.3-E13.11, E13.3-E14.1, E14.3-E14.9, P70.0-P70.2, R73-R73.9, Z13.1, Z83.3	250-250.39, 250.5-250.99, 357.2, 362.0-362.07, 366.41, 775.0, 775.1, 790.2-790.22, V18, V18.0, V42.83, V45.85, V58.67, V77.1
Acute glomerulonephritis	N00-N01.9	580-580.9
Chronic kidney disease	E10.2-E10.29, E11.2-E11.29, E12.2, E13.2-E13.29, E14.2, I12-I13.9, N02-N08.8, N15.0, N18-N18.9, Z49-Z49.32, Z52.4, Z99.2	250.4-250.49, 403-404.93, 581-583.9, 585-585.9, 589-589.9, V13.03, V13.09, V18.6, V18.69, V42.0, V45.1-V45.12, V45.73, V56-V56.8, V59.4, V81.5, V81.6
Chronic kidney disease due to diabetes mellitus	E10.2-E10.29, E11.2-E11.29, E12.2, E13.2-E13.29, E14.2	250.4-250.49
Chronic kidney disease due to hypertension	I12-I13.9	403-404.93
Chronic kidney disease due to glomerulonephritis	N03-N06.9	581-583.9
Chronic kidney disease due to other causes	N02-N02.9, N07-N08.8, N15.0	589-589.9
Urinary diseases and male infertility	N10-N12.9, N15, N15.1-N16.8, N20-N23.0, N25-N32.0, N32.3, N32.4, N34-N37.8, N39-N39.8, N40-N53.9, Z43.5-Z43.7, Z84.1, Z84.2	588-588.9, 590-590.9, 592-593.89, 594-596.81, 596.89-598.1, 598.8-599.6, 599.8-599.89, 600-608.89, 788.0, 788.3-788.39, V13.0-V13.02, V26.5, V26.52, V45.74, V47.4, V58.76
Interstitial nephritis and urinary tract infections	N10-N12.9, N15, N15.1-N16.8, N30-N30.91, N34-N34.3, N39.0-N39.2	590-590.9, 595-595.9, 597-597.9, 599.0, V13.02
Urolithiasis	N20-N23.0	592-592.9, 594-594.9, 788.0, V13.01
Benign prostatic hyperplasia	N40-N40.9	600-600.91
Male infertility due to other causes	N46-N46.9, Z43.7	606-606.9, V26.5, V26.52
Other urinary diseases	N25-N29.8, N31-N32.0, N32.3, N32.4, N35-N37.8, N39, N39.3-N39.8, N41-N45.9, N47-N53.9	588-588.9, 593-593.89, 596-596.81, 596.89, 596.9, 598-598.1, 598.8-599, 599.1-599.6, 599.8-599.89, 601-605.9, 607-608.89, 788.3-788.39
Gynecological diseases	B37.3-B37.49, E28.2, N61-N64.9, N72, N72.0, N75-N77.8, N80-N81.9, N83-N83.9, N85-N86, N88-N88.9, N91.5, N94.3, N95, N95.1-N95.9, N97-N97.9, Z01.4-Z01.7, Z31-Z31.9, Z86.1-Z86.19, Z87.4-Z87.448	112.1, 112.2, 220-220.9, 256.4, 611-612.1, 615-616.9, 620-620.9, 621.4-621.9, 622.3-622.7, 623, 623.2-623.6, 623.8-624.9, 625.4, 627-629.81, V07.4-V07.59, V13.2, V13.29, V18.7, V26-V26.49, V26.51, V26.8, V26.9, V43.82, V45.71, V45.83, V47.5, V49.81, V59.7-V59.74, V72.3, V72.31
Uterine fibroids		
Polycystic ovarian syndrome	E28.2	256.4
Female infertility due to other causes	N97-N97.9, Z31-Z31.9	628-628.9, V26-V26.49, V26.51, V26.8-V26.9, V59.7-V59.74
Endometriosis	N80-N80.9	617-617.9
Genital prolapse	N81-N81.9	618-618.9
Premenstrual syndrome	N94.3	625.4
Other gynecological diseases	B37.3-B37.49, N61-N64.9, N72, N72.0, N75-N77.8, N83-N83.9, N85-N86, N88-N91.5, N95, N95.1-N95.9	112.1, 112.2, 220-220.9, 611-612.1, 615-616.9, 620-620.9, 621.4-621.9, 622.3-622.7, 623, 623.2-623.6, 623.8-624.9, 625.4, 627-629.81, V07.4-V07.59
Hemoglobinopathies and hemolytic anemias	D55-D58.9, D59.1, D59.3, D59.5, D60-D61.09, D61.2-D61.9, D64.0, D64.4	282-284.9, 713.2, V78, V78.2-V78.9
Thalassemias	D56-D56.9	282.4-282.49
Thalassemia trait	D57-D57.819	282.5-282.68, V78.2
Sickle cell disorders	D55-D55.9	282.2, 282.3
Sickle cell trait	D58-D58.9, D59.1, D59.3, D59.5, D60-D61.09, D61.2-D61.9, D64.0, D64.4	282-282.1, 282.69-284.9, 713.2
G6PD deficiency		
G6PD trait		
Other hemoglobinopathies and hemolytic anemias	D52.1, D59.0, D59.2, D59.6, D61.1, D66-D69.8, D70-D75.89, D76-D78.89, D80-D83.9, D84.0-D84.8, D86.3, D86.87, D89-D89.9, E03-E07.1, E09-E09.9, E15-E16.9, E20-E28.1, E28.3-E34.8, E36-E36.8, E65-E68, E70-E85.29, E87.71, E88-E89.9, G21.1-G21.19, G24.0-G24.09, G25.1, G25.4, G25.6-G25.79, G62.0, G72.0, G93.7, G97-G97.9, H59-H59.89, H95-H95.9, I95.2, I95.3, I97-198.9, J70.2-J70.5, J95-J95.9, K43-K43.9, K62.7, K91-K92, K94-K95.89, L23.3, L24.4, L25.1, L27.0, L27.1, L56, L56.0, L58-L58.9, M10.2-M10.29, M83.5, M87.1-M87.19, M96-M96.9, N14-N14.4, N65-N65.1, N99-N99.9, P03.2-P03.5, P96.2, P96.5, R50.2, R50.82, R50.83, Z21.0, Z42-Z43.0, Z43.8, Z43.9, Z48-Z48.9, Z51-Z51.9, Z83.4-Z83.49, Z88-Z88.9, Z92-Z94.0, Z94.6, Z94.8-Z94.9, Z96-Z96.49, Z96.6-Z97.2, Z97.8-Z99.12	240-243.9, 244.0, 244.1, 244.3, 244.8, 245-246.9, 251-256.39, 256.8-259.9, 270-273.9, 275-276, 277-277.2, 277.30-277.9, 278.0-279.19, 279.4-279.6, 286-286.5, 286.7-289.9, 349.0, 349.1, 357.6, 518.7, 519.0-519.09, 536.4-536.49, 539-539.9, 551.2-551.29, 552.2-552.29, 564.2-564.4, 569.6-569.69, 579.3, 596.82, 596.83, 598.2, 598.3, 598.4, 598.5, 598.6, 598.7, 598.8, 598.9, 599.0, 599.1, 599.2, 599.3, 599.4, 599.5, 599.6, 599.7, 599.8, 599.9, 600, 600.1, 600.2, 600.3, 600.4, 600.5, 600.6, 600.7, 600.8, 600.9, 601, 601.1, 601.2, 601.3, 601.4, 601.5, 601.6, 601.7, 601.8, 601.9, 602, 602.1, 602.2, 602.3, 602.4, 602.5, 602.6, 602.7, 602.8, 602.9, 603, 603.1, 603.2, 603.3, 603.4, 603.5, 603.6, 603.7, 603.8, 603.9, 604, 604.1, 604.2, 604.3, 604.4, 604.5, 604.6, 604.7, 604.8, 604.9, 605, 605.1, 605.2, 605.3, 605.4, 605.5, 605.6, 605.7, 605.8, 605.9, 606, 606.1, 606.2, 606.3, 606.4, 606.5, 606.6, 606.7, 606.8, 606.9, 607, 607.1, 607.2, 607.3, 607.4, 607.5, 607.6, 607.7, 607.8, 607.9, 608, 608.1, 608.2, 608.3, 608.4, 608.5, 608.6, 608.7, 608.8, 608.9, 609, 609.1, 609.2, 609.3, 609.4, 609.5, 609.6, 609.7, 609.8, 609.9, 610, 610.1, 610.2, 610.3, 610.4, 610.5, 610.6, 610.7, 610.8, 610.9, 611, 611.1, 611.2, 611.3, 611.4, 611.5, 611.6, 611.7, 611.8, 611.9, 612, 612.1, 612.2, 612.3, 612.4, 612.5, 612.6, 612.7, 612.8, 612.9, 613, 613.1, 613.2, 613.3, 613.4, 613.5, 613.6, 613.7, 613.8, 613.9, 614, 614.1, 614.2, 614.3, 614.4, 614.5, 614.6, 614.7, 614.8, 614.9, 615, 615.1, 615.2, 615.3, 615.4, 615.5, 615.6, 615.7, 615.8, 615.9, 616, 616.1, 616.2, 616.3, 616.4, 616.5, 616.6, 616.7, 616.8, 616.9, 617, 617.1, 617.2, 617.3, 617.4, 617.5, 617.6, 617.7, 617.8, 617.9, 618, 618.1, 618.2, 618.3, 618.4, 618.5, 618.6, 618.7, 618.8, 618.9, 619, 619.1, 619.2, 619.3, 619.4, 619.5, 619.6, 619.7, 619.8, 619.9, 620, 620.1, 620.2, 620.3, 620.4, 620.5, 620.6, 620.7, 620.8, 620.9, 621, 621.1, 621.2, 621.3, 621.4, 621.5, 621.6, 621.7, 621.8, 621.9, 622, 622.1, 622.2, 622.3, 622.4, 622.5, 622.6, 622.7, 622.8, 622.9, 623, 623.1, 623.2, 623.3, 623.4, 623.5, 623.6, 623.7, 623.8, 623.9, 624, 624.1, 624.2, 624.3, 624.4, 624.5, 624.6, 624.7, 624.8, 624.9, 625, 625.1, 625.2, 625.3, 625.4, 625.5, 625.6, 625.7, 625.8, 625.9, 626, 626.1, 626.2, 626.3, 626.4, 626.5, 626.6, 626.7, 626.8, 626.9, 627, 627.1, 627.2, 627.3, 627.4, 627.5, 627.6, 627.7, 627.8, 627.9, 628, 628.1, 628.2, 628.3, 628.4, 628.5, 628.6, 628.7, 628.8, 628.9, 629, 629.1, 629.2, 629.3, 629.4, 629.5, 629.6, 629.7, 629.8, 629.9, 630, 630.1, 630.2, 630.3, 630.4, 630.5, 630.6, 630.7, 630.8, 630.9, 631, 631.1, 631.2, 631.3, 631.4, 631.5, 631.6, 631.7, 631.8, 631.9, 632, 632.1, 632.2, 632.3, 632.4, 632.5, 632.6, 632.7, 632.8, 632.9, 633, 633.1, 633.2, 633.3, 633.4, 633.5, 633.6, 633.7, 633.8, 633.9, 634, 634.1, 634.2, 634.3, 634.4, 634.5, 634.6, 634.7, 634.8, 634.9, 635, 635.1, 635.2, 635.3, 635.4, 635.5, 635.6, 635.7, 635.8, 635.9, 636, 636.1, 636.2, 636.3, 636.4, 636.5, 636.6, 636.7, 636.8, 636.9, 637, 637.1, 637.2, 637.3, 637.4, 637.5, 637.6, 637.7, 637.8, 637.9, 638, 638.1, 638.2, 638.3, 638.4, 638.5, 638.6, 638.7, 638.8, 638.9, 639, 639.1, 639.2, 639.3, 639.4, 639.5, 639.6, 639.7, 639.8, 639.9, 640, 640.1, 640.2, 640.3, 640.4, 640.5, 640.6, 640.7, 640.8, 640.9, 641, 641.1, 641.2, 641.3, 641.4, 641.5, 641.6, 641.7, 641.8, 641.9, 642, 642.1, 642.2, 642.3, 642.4, 642.5, 642.6, 642.7, 642.8, 642.9, 643, 643.1, 643.2, 643.3, 643.4, 643.5, 643.6, 643.7, 643.8, 643.9, 644, 644.1, 644.2, 644.3, 644.4, 644.5, 644.6, 644.7, 644.8, 644.9, 645, 645.1, 645.2, 645.3, 645.4, 645.5, 645.6, 645.7, 645.8, 645.9, 646, 646.1, 646.2, 646.3, 646.4, 646.5, 646.6, 646.7, 646.8, 646.9, 647, 647.1, 647.2, 647.3, 647.4, 647.5, 647.6, 647.7, 647.8, 647.9, 648, 648.1, 648.2, 648.3, 648.4, 648.5, 648.6, 648.7, 648.8, 648.9, 649, 649.1, 649.2, 649.3, 649.4, 649.5, 649.6, 649.7, 649.8, 649.9, 650, 650.1, 650.2, 650.3, 650.4, 650.5, 650.6, 650.7, 650.8, 650.9, 651, 651.1, 651.2, 651.3, 651.4, 651.5, 651.6, 651.7, 651.8, 651.9, 652, 652.1, 652.2, 652.3, 652.4, 652.5, 652.6, 652.7, 652.8, 652.9, 653, 653.1, 653.2, 653.3, 653.4, 653.5, 653.6, 653.7, 653.8, 653.9, 654, 654.1, 654.2, 654.3, 654.4,

Appendix Table A.2: List of International Classification of Diseases codes mapped to the Global Burden of Disease cause list for causes of disability

Cause Name	ICD-10 Code	ICD-9 Code
Low back and neck pain	G54.1-G54.4, G57.0-G57.12, M43.2-M43.9, M45-M49, M49.2-M51.9, M53-M54.9, M99, M99.1-M99.9	353.1-353.4, 355.0, 720-721.1, 721.3, 721.5, 721.6, 721.8-724.9, 737-737.9
Low back pain	G54.1, G54.3, G54.4, G57.0-G57.12, M43.2-M43.5, M43.8, M43.9, M45-M49, M49.2-M49.89, M51-M51.9, M53, M53.2-M54, M54.1-M54.18, M54.3-M54.9, M99, M99.1-M99.9	353.1, 353.3, 353.4, 355.0, 720-721, 721.3, 721.5, 721.6, 721.8-722, 722.1-722.39, 722.5-722.70, 722.72-722.80, 722.82-722.90, 722.92, 722.93, 724-724.9, 737-737.9
Neck pain	G54.2, M50-M50.93, M53.0, M53.1, M54.0-M54.09, M54.2	353.2, 721.0, 721.1, 722.0, 722.4, 722.71, 722.81, 722.91, 723-723.9
Gout	M10-M10.19, M10.3-M10.9	274-274.9
	I27.1, I93-L93.2, M00-M03.0, M03.2, M03.6, M07-M08, M08.9-M09.0, M09.2, M09.8, M11-M12, M12.2, M12.49, M12.8-M12.9, M14-M14.89, M22-M25.879, M30-M32.9, M34-M36.8, M40-M43.19, M65-M68.8, M70-M73, M73.8, M75-M77.9, M80-M83.4, M83.8-M87.09, M87.3-M89.59, M89.7-M95.9, M99.0-M99.09	416.1, 416.2, 446-446.9, 695.4-695.59, 710-712.99, 716.2-716.39, 719.2-719.39, 719.8-719.89, 721.2, 721.4-721.42, 726-727.9, 730-730.39, 732-734.2, 739-739.9
Other musculoskeletal disorders	A31.1, A31.2, A46, A46.0, B07-B09, B30-B30.9, B31.9, B32.3, B32.4, B35-B36.9, B85-B88.9, H00-H02.8, H02.82, H02.9, H04-H05.429, H05.8-H06.3, H10-H11.9, H13-H13.8, H15-H22.8, H25-H26.09, H26.2, H28.8, H30-H36.8, H40-H40.9, H42-H44.539, H44.8-H45.89, H57-H58.9, H60-H62.8, H80-H83.93, H90-H91.93, H93-H94.83, K02-K02.9, K05-K05.6, L00-L05.92, L08-L08.9, L10-L14.0, L20-L23.2, L23.4-L24.3, L24.5-L25.0, L25.2-L27, L27.2-L30.9, L40-L45, L49-L55.9, L56.1-L57.9, L59-L60.9, L62-L68.9, L70-L76.82, L80-L92.9, L94-L95.9, L97-L98.6, M26-M27.9, P96.0, Q00-Q07.9, Q10-Q18.9, Q20-Q28.9, Q30-Q45.9, Q50-Q86, Q86.1-Q87.89, Q89-Q89.8, Q90-Q93.9, Q95-Q99.8, Z01.0-Z01.12, Z13.5, Z13.7-Z13.79, Z13.84, Z14-Z15.89, Z41.1, Z41.3, Z52.5, Z82.1, Z82.2, Z82.7-Z82.79, Z83.5-Z83.52, Z84.0, Z87.2, Z87.7-Z87.798, Z94.5, Z94.7, Z96.5, Z97.3, Z97.4	035-035.9, 077-078.4, 110-111.9, 132-134.9, 360-360.44, 360.8-362, 362.1-366.19, 366.3-366.4, 366.42-374.85, 374.87-376.52, 376.8-380.9, 385-385.82, 385.89-389.9, 520-529.9, 680-695.3, 695.8-709.3, 709.8, 709.9, 713.3, 740-758.9, 759.0-759.89, 707.31, V13.3, V13.6-V13.69, V18.61, V18.9, V19.0-V19.5, V19.7, V19.8, V42.3, V42.5, V43.0, V43.1, V43.83, V45.6-V45.69, V45.78, V45.84, V48.4, V48.5, V50.3, V58.5, V58.71, V58.77, V59.1, V59.5, V72.2, V74.4, V80, V80.0, V80.09-V80.3, V82.0, V82.3
Other non-communicable diseases	P96.0, Q00-Q07.9, Q10-Q18.9, Q20-Q28.9, Q30-Q45.9, Q50-Q86, Q86.1-Q87.89, Q89-Q89.8, Q90-Q93.9, Q95-Q99.8, Z13.7-Z13.79, Z14-Z15.89, Z82.7-Z82.79, Z87.7-Z87.798	740-758.9, 759.0-759.89, V13.6-V13.69, V18.61, V18.9, V19.5, V19.7, V19.8, V82.3
Congenital anomalies		
Neural tube defects	Q00-Q01.9, Q05-Q05.9	740-741.93, 742.0, V13.63
Congenital heart anomalies	Q20-Q28.9	745-747.9, V13.65, V18.61
Orofacial clefts	Q35-Q37.9	749-749.9
Down syndrome	Q90-Q90.9	758.0
Turner syndrome	Q96-Q96.9	
Klinefelter syndrome	Q98-Q98.9	
Chromosomal unbalanced rearrangements	Q91-Q93.9, Q95-Q95.9, Q97-Q97.9, Q99-Q99.8	758, 758.1-758.9
Other congenital anomalies	P96.0, Q02-Q04.9, Q06-Q07.9, Q10-Q18.9, Q30-Q34.9, Q38-Q45.9, Q50-Q86, Q86.1-Q87.89, Q89-Q89.8	742, 742.1-744.9, 748-748.9, 750-757.9, 759.0-759.89, V13.61, V13.62, V13.64, V13.66-V13.69
Skin and subcutaneous diseases	A31.1, A31.2, A46, A46.0, B07-B09, B35-B36.9, B85-B88.9, L00-L05.92, L08-L08.9, L10-L14.0, L20-L23.2, L23.4-L24.3, L24.5-L25.0, L25.2-L27, L27.2-L30.9, L40-L45, L49-L55.9, L56.1-L57.9, L59-L60.9, L62-L68.9, L70-L76.82, L80-L92.9, L94-L95.9, L97-L98.6, Z41.1, Z84.0, Z87.2, Z94.5	035-035.9, 078-078.4, 110-111.9, 132-134.9, 680-695.3, 695.8-709.3, 709.8, 709.9, 713.3, V13.3, V19.4, V42.3, V43.83, V58.77, V59.1, V82.0
Dermatitis	L20-L23.2, L23.4-L24.3, L24.5-L25.0, L25.2-L27, L27.2-L27.9	690-693.9
Psoriasis	L40-L41.9	696-696.9
Cellulitis	L03-L04	681-682.9
Pyoderma	A31.1, A31.2, A46, A46.0, L00-L02.93, L04.0-L05.92, L08-L08.9, L88, L97-L98.499	035-035.9, 680-680.9, 683-686.9
Scabies	B86	133-133.6
Fungal skin diseases	B35-B36.9	110-111.9
Viral skin diseases	B07-B09	078-078.4
Acne vulgaris	L70-L70.3, L70.8, L70.9, L73.0	706.1, 706.2
Alopecia areata	L63-L63.1, L63.8, L63.9	704.0-704.09
Pruritus	L29-L29.9	698-698.9
Urticaria	L50-L50.9	708-708.9
Decubitus ulcer	L89-L89.95	707-707.9
Other skin and subcutaneous diseases	B85-B85.4, B87-B88.9, L10-L14.0, L28-L28.2, L30-L30.9, L42-L45, L49-L49.9, L51-L55.9, L56.1-L57.9, L59-L60.9, L62-L62.8, L63.2, L64-L68.9, L70.4, L70.5, L71-L73, L73.1-L76.82, L80-L87.9, L90-L92.9, L94-L95.9, L98.5, L98.6	132-132.9, 133.8-134.9, 694-695.3, 695.8-695.9, 697-697.9, 700-704, 704.1-706.0, 706.3-706.9, 709-709.3, 709.8, 709.9, 713.3
Sense organ diseases	B30-B30.9, B31.9, B32.3, B32.4, H00-H02.8, H02.82, H02.9, H04-H05.429, H05.8-H06.3, H10-H11.9, H13-H13.8, H15-H22.8, H25-H26.09, H26.2-H28.8, H30-H36.8, H40-H40.9, H42-H44.539, H44.8-H45.89, H57-H58.9, H60-H62.8, H80-H83.93, H90-H91.93, H93-H94.83, Z01.0-Z01.12, Z13.5, Z41.3, Z52.5, Z82.1, Z82.2, Z83.5-Z83.52, Z94.7, Z97.3, Z97.4	077-077.99, 360-360.44, 360.8-362, 362.1-366.19, 366.3-366.4, 366.42-374.85, 374.87-376.52, 376.8-380.9, 385-385.82, 385.89-389.9, V19.0-V19.3, V42.5, V43.0, V43.1, V45.6-V45.69, V45.78, V48.4, V48.5, V50.3, V58.71, V59.5, V74.4, V80, V80.0, V80.09-V80.3
Glaucoma	H36, H36.0, H40-H40.9, H42-H42.8	365-365.9, V19.11
Cataract	H25-H26.09, H26.2-H26.9, H28-H28.2	366-366.19, 366.3-366.4, 366.42-366.9
Macular degeneration	H35.3-H35.389	362.50-362.57
Uncorrected refractive error	H49-H51.9	367-368.9, 378-378.9
Age-related and other hearing loss	H80-H80.93, H90-H91.93, H93-H94.83	385-385.82, 385.89, 385.9, 387-387.9, 389-389.9, V19.2
Age-related and other vision loss	H30-H32.0, H33-H35.23, H35.4-H35.9, H43-H43.9, H46-H48.1, H52-H54.9	361-362, 362.1-362.5, 362.6-363.9, 364.5-364.9, 369-369.9
Other sense organ diseases	B30-B30.9, B31.9, B32.3, B32.4, H00-H02.8, H02.82, H02.9, H04-H05.429, H05.8-H06.3, H10-H11.9, H13-H13.8, H15-H22.8, H27-H27.9, H28.8, H32.8, H36.8, H44-H44.539, H44.8-H45.8, H48.8, H55-H55.89, H57-H58.9, H60-H62.8, H81-H83.93	077-077.99, 360-360.44, 360.8-360.9, 364-364.42, 370-374.85, 374.87-376.52, 376.8-377.9, 379-380.9, 386-386.9, 388-388.9, V74.4
Oral disorders	K02-K02.9, K05-K05.6, M26-M27.9, Z01.2-Z01.21, Z13.84, Z96.5	520-529.9, V07.31, V45.84, V58.5, V72.2
Deciduous caries		
Permanent caries	K02-K02.9	521.0-522.9, V07.31
Periodontal diseases	K05-K05.6	523-523.9
Edentulism and severe tooth loss		525.0-525.19, 525.4-525.54
Other oral disorders	M26-M27.9	520-521, 524-525, 525.2-525.3, 525.6-529.9
Sudden infant death syndrome		
	H02.81, H02.819, H05.5-H05.53, H44.6-H44.799, M60.2-M60.28, V00-V86.99, V87.2, V87.3, V88.2, V88.3, V90, V90.0, V90.01-V98.8, W00-W46.2, W49-W62.9, W64-W70.9, W73-W81.9, W83-W94.9, W97.9, W99-X06.9, X08-X40.9, X43-X43.9, X46-X48.9, X50-X54.9, X57-X58.9, X60-X08.9, Y35-Y84.9, Y87.1-Y88.3, Y89.0, Y89.1, Z03.6, Z04.1-Z04.5, Z13.850, Z18-Z18.9	360.5-360.69, 374.86, 376.6, 385.83, 709.4, 728.82, 729.6, E00.0-E03.0, E80.0-E80.03, E80.1-E80.13, E80.2-E80.23, E80.3-E80.33, E80.4-E80.43, E80.5-E80.53, E80.6-E80.63, E80.7-E80.73, E81.00-E81.07, E81.10-E81.17, E81.20-E81.27, E81.30-E81.37, E81.40-E81.47, E81.50-E81.57, E81.60-E81.67, E81.70-E81.77, E81.80-E81.87, E81.90-E81.97, E82.00-E82.07, E82.10-E82.17, E82.20-E82.27, E82.30-E82.37, E82.40-E82.47, E82.50-E82.57, E82.60-E82.67, E82.70-E82.74, E82.80-E82.84, E82.90, E82.94, E83.0-E83.89, E84.0-E84.99, E85.03-E85.089, E85.48-E85.899, E86.02-E86.999, E87.0-E87.69, E87.8-E88.699, E88.8-E92.889, E92.91-E92.94, E93.0-E97.99, E99.0-E99.91, V15.4-V15.5, V15.53-V15.6, V15.88, V90-V90.9
Injuries	V00-V86.99, V87.2, V87.3, V88.2, V88.3, V91-V91.9, V93-V98.8, Z04.1	E80.0-E80.03, E80.1-E80.13, E80.2-E80.23, E80.3-E80.33, E80.4-E80.43, E80.5-E80.53, E80.6-E80.63, E80.7-E80.73, E81.00-E81.07, E81.10-E81.17, E81.20-E81.27, E81.30-E81.37, E81.40-E81.47, E81.50-E81.57, E81.60-E81.67, E81.70-E81.77, E81.80-E81.87, E81.90-E81.97, E82.00-E82.07, E82.10-E82.17, E82.20-E82.27, E82.30-E82.37, E82.40-E82.47, E82.50-E82.57, E82.60, E82.61, E82.63, E82.64, E82.70, E82.73, E82.74, E82.80, E82.84, E82.90, E82.94
Transport injuries	V01-V04.99, V06-V80.929, V82-V82.9, V87.2, V87.3	E80.03, E80.13, E80.23, E80.33, E80.43, E80.53, E80.63, E80.73, E81.00-E81.06, E81.10-E81.17, E81.20-E81.27, E81.30-E81.37, E81.40-E81.47, E81.50-E81.57, E81.60-E81.67, E81.70-E81.77, E81.80-E81.87, E81.90-E81.97, E82.00-E82.06, E82.10-E82.16, E82.20-E82.27, E82.30-E82.37, E82.40-E82.47, E82.50-E82.57, E82.60, E82.61, E82.63, E82.64, E82.70, E82.73, E82.74, E82.80, E82.84, E82.90, E82.94
Road injuries	V01-V04.99, V06-V09.9	E81.17, E81.27, E81.37, E81.47, E81.57, E81.67, E81.77, E81.87, E81.97, E82.27, E82.37, E82.47, E82.57, E82.60, E82.70, E82.80, E82.90
Pedestrian road injuries	V10-V19.9	E80.03, E80.13, E80.23, E80.33, E80.43, E80.53, E80.63, E80.73, E81.06, E81.16, E81.26, E81.36, E81.46, E81.56, E81.66, E81.76, E81.86, E81.96, E82.06, E82.16, E82.26, E82.36, E82.46, E82.56, E82.61
Cyclist road injuries	V20-V29.9	E81.02, E81.03, E81.12, E81.13, E81.22, E81.23, E81.32, E81.33, E81.42, E81.43, E81.52, E81.53, E81.62, E81.63, E81.72, E81.73, E81.82, E81.83, E81.92, E81.93, E82.02, E82.03, E82.12, E82.13, E82.22, E82.23, E82.32, E82.33, E82.42, E82.43, E82.52, E82.53
Motorcyclist road injuries	V30-V79.9, V87.2, V87.3	E81.00, E81.01, E81.10, E81.11, E81.20, E81.21, E81.30, E81.31, E81.40, E81.41, E81.50, E81.51, E81.60, E81.61, E81.70, E81.71, E81.80, E81.81, E81.90, E81.91, E82.00, E82.01, E82.10, E82.11, E82.20, E82.21, E82.30, E82.31, E82.40, E82.41, E82.50, E82.51
Motor vehicle road injuries		

Appendix Table A.2: List of International Classification of Diseases codes mapped to the Global Burden of Disease cause list for causes of disability

Cause Name	ICD-10 Code	ICD-9 Code
	V80-V80.929, V82-V82.9	E81.04, E81.05, E81.14, E81.15, E81.24, E81.25, E81.34, E81.35, E81.44, E81.45, E81.54, E81.55, E81.64, E81.65, E81.74, E81.75, E81.84, E81.85, E81.94, E81.95, E82.04, E82.05, E82.14, E82.15, E82.24, E82.25, E82.34, E82.35, E82.44, E82.45, E82.54, E82.55, E82.63, E82.64, E82.73, E82.74, E82.84, E82.94
Other road injuries	V00-V00.898, V05-V05.99, V81-V81.9, V83-V86.99, V88.2, V88.3, V91-V91.9, V93-V98.8	E80.0-E80.02, E80.1-E80.12, E80.2-E80.22, E80.3-E80.32, E80.4-E80.42, E80.5-E80.52, E80.6-E80.62, E80.7-E80.72, E81.07, E82.07, E82.17, E82.22, E82.27, E82.32, E83.1-E83.19, E83.3-E83.89, E84.0-E84.99, E92.91
Other transport injuries	H02.81-H02.819, H05.5-H05.53, H44.6-H44.799, M60.2-M60.28, V90, V90.0, V90.01-V90.9, V92-V92.9, W00-W46.2, W49-W62.9, W64-W70.9, W73-W81.9, W83-W94.9, W97.9, W99-X06.9, X08-X29.9, X40-X40.9, X43-X43.9, X46-X48.9, X50-X54.9, X57-X58.9, Y38.9-Y84.9, Y88-Y88.3, Z03.6, Z04.2, Z04.3, Z18-Z18.9	360.5-360.69, 374.86, 376.6, 385.83, 709.4, 728.82, 729.6, E00.0-E03.0, E83.0-E83.09, E83.2-E83.29, E85.03-E85.089, E85.48-E85.899, E86.02-E86.999, E87.0-E87.69, E87.8-E88.699, E88.8-E89.909, E90.01-E90.019, E90.11-E90.119, E90.2-E90.4, E90.41-E90.699, E91.0-E92.889, E92.92-E92.94, E93.0-E94.99, V15.53, V15.6, V15.88, V90-V90.9
Unintentional injuries	W00-W19.9	E88.0-E88.699, E88.8-E88.89, E92.93, V15.88
Falls	V90, V90.0, V90.01-V90.9, V92-V92.9, W65-W70.9, W73-W74.9	E83.0-E83.09, E83.2-E83.29, E91.0-E91.099
Drowning	X00-X06.9, X08-X19.9, X20.5	E89.0-E89.909, E92.4-E92.499, E92.94
Fire, heat, and hot substances	X40-X40.9, X43-X43.9, X46-X48.9, Z03.6	E85.03-E85.089, E85.48-E85.899, E86.02-E86.999, E92.92, V15.6
Poisonings	W20-W38.9, W40-W43.9, W45.0-W45.2, W46-W46.1, W49-W52, W52.3, W75-W76.9, Z04.2	E91.3-E91.319, E91.6-E92.299, E92.81-E92.87
Exposure to mechanical forces	W32-W34.9	E92.2-E92.299, E92.87
Unintentional firearm injuries	W75-W76.9	E91.3-E91.319
Unintentional suffocation	W20-W31.9, W35-W38.9, W40-W43.9, W45.0-W45.2, W46-W46.1, W49-W52, W52.3	E91.6-E92.199, E92.81-E92.86
Other exposure to mechanical forces	Y38.9-Y84.9, Y88-Y88.3	E87.0-E87.69, E87.8-E87.99, E93.0-E94.99
Adverse effects of medical treatment	W52.0-W52.2, W52.4-W62.9, W64-W64.9, X20-X20.4, X20.6-X29.9	E90.5-E90.699
Animal contact	X20-X20.4, X20.6-X29.9	E90.5-E90.599
Venomous animal contact	W52.0-W52.2, W52.4-W62.9, W64-W64.9	E90.6-E90.699
Non-venomous animal contact	H02.81-H02.819, H05.5-H05.53, H44.6-H44.799, M60.2-M60.28, W44-W45, W45.3-W45.9, W46.2, W78-W80.9, W83-W84.9, Z18-Z18.9	360.5-360.69, 374.86, 376.6, 385.83, 709.4, 728.82, 729.6, E91.1-E91.209, E91.38-E91.509, V15.53, V90-V90.9
Foreign body	W78-W80.9, W83-W84.9	E91.1-E91.209, E91.38-E91.399
Pulmonary aspiration and foreign body in airway	H02.81-H02.819, H05.5-H05.53, H44.6-H44.799	360.5-360.69, 374.86, 376.6, 385.83, 709.4, 728.82, 729.6, E91.4-E91.409, V15.53
Foreign body in eyes	M60.2-M60.28, W44-W45, W45.3-W45.9, W46.2	E91.5-E91.509
Foreign body in other body part	W39-W39.9, W77-W77.9, W81-W81.9, W85-W94.9, W97.9, W99-W99.9, X50-X54.9, X57-X58.9, Z04.3	E00.0-E03.0, E90.01-E90.019, E90.11-E90.119, E90.2-E90.4, E90.41-E90.499, E91.32-E91.339, E92.3-E92.399, E92.5-E92.809, E92.88-E92.889, E90.40-E90.409, E95.0-E96.9, V15.41
Other unintentional injuries	X60-Y08.9, Y87.1, Y87.2, Z04.4-Z04.5	E95.0-E95.9
Self-harm and interpersonal violence	X60-X84.9	E90.40-E90.409, E96.0-E96.9, V15.41
Self-harm	X85-Y08.9, Y87.1, Y87.2, Z04.4-Z04.5	E96.5-E96.54
Interpersonal violence	X93-X94.0, X94.3-X94.7, X94.9-X95.9, X96.5	E96.6
Assault by firearm	X99-X99.9	E90.40-E90.409, E96.0-E96.4, E96.55-E96.59, E96.7-E96.9
Assault by sharp object	X85-X92.9, X94.1, X94.2, X94.8, X96-X96.4, X96.6-X98.9, Y00-Y08.9, Y87.1, Y87.2	E90.0-E90.009, E90.09-E90.109, E90.18-E90.199, E90.7-E90.999, E97.0-E97.999, E99.0-E99.91
Assault by other means	X30-X39.9, Y35-Y38.893, Y89.0, Y89.1	E90.0-E90.009, E90.09-E90.109, E90.18-E90.199, E90.7-E90.999
Forces of nature, war, and legal intervention	X30-X39.9	E97.0-E97.999, E99.0-E99.91
Exposure to forces of nature	Y35-Y38.893, Y89.0, Y89.1	None
Collective violence and legal intervention	None	T05.3, T05.5
None	T05.3, T05.5	896.2, 896.3, 897.6, 897.7
Amputation of lower limbs, bilateral	T27-T27.7	947.0-947.2
Lower airway burns	S73-S73.046	835-835.13
Dislocation of hip	S83-S83.1, S83.7-S83.9	836-836.69
Dislocation of knee	S43-S43.396	831-831.19
Dislocation of shoulder	S03-S03.9, S13-S13.9, S16-S16.9, S23-S23.9, S29-S29.099, S33-S33.9, S39.0-S39.6, S43.4-S43.92, S46-S46.999, S49.8-S49.92, S53-S53.7, S56-S56.9, S59.7-S59.919, S63-S63.9, S66-S66.9, S69-S69.92, S73.1-S73.199, S76-S76.999, S83.2-S83.6, S86-S86.999, S93-S93.699, S96-S96.999, S99-S99.929, T03-T03.9, T09.2, T09.5, T11.2, T13.2, T14.3, T92.3, T93.3, T93.5	830-830.1, 832-834.12, 837-849, 905.6-905.8
Muscle and tendon injuries, including sprains and strains lesser dislocations	S42-S42.9, S49-S49.7, T92.1	810-812.59
Fracture of clavicle, scapula, or humerus	S02.2-S02.7	802-802.9
Fracture of face bones	S92-S92.9	825-826.6
Fracture of foot bones except ankle	S62-S62.9, T92.2	814-816.13
Fracture of hand (wrist and other distal part of hand)	S72.0-S72.2	820-820.9, 905.3
Fracture of hip	S68.4-S68.429, S68.7-S68.9, T05.0, T05.2, T05.6	887.6-888.9
Amputation of upper limbs, bilateral	S82-S82.9, S89.0-S89.7	822-824.9, 905.4
Fracture of patella, tibia or fibula, or ankle	S32.3-S32.9	808-808.9
Fracture of pelvis	S52-S52.9, S59-S59.299	813-813.93, 905.2
Fracture of radius and/or ulna	S02-S02.19, S02.8-S02.92	800-801.99, 803-804.99, 905.0
Fracture of skull	S22.2-S22.9	807-807.04, 807.07-807.6
Fracture of sternum and/or fracture of one or more ribs	S12-S12.9, S22-S22.1, S32-S32.2, T08, T08.0, T91.1	310.2, 805-805.9, 905.1
Fracture of vertebral column	S72, S72.3-S72.9, S79-S79.199, T93.1	821-821.39
Fracture of femur, other than femoral neck	G44.31-G44.319, S06.0	850-850.9
Minor TBI	S06, S06.1, S06.3-S06.6, S06.9, S07, T90.2	852-852.59, 907, 907.0, V15.52
Moderate TBI	S06.2, S06.7, S06.8, T90.5	851-851.99, 853-854.19
Severe TBI	S68.1-S68.3, S68.6-S68.629	886-886.1
Amputation of fingers (excluding thumb)	T16-T16.9	931
Foreign body in ear	T17-T17.998	932-934.9
Foreign body in respiratory system	T18-T19.9	935-939.9
Foreign body in GI and urogenital system	S14-S14.159, T91.3	806-806.19, 952-952.09
Spinal cord lesion at neck level	S24-S24.159, S34-S34.139	806.2-806.9, 952.1-952.9
Spinal cord lesion below neck level	T75.1	994.1
Drowning and nonfatal submersion	T71-T71.9	994.7
Asphyxiation	S07.0-S07.9, S17-S18, S38-S38.3, S47-S47.9, S57-S57.9, S67-S67.92, S77-S77.22, S87-S87.82, S97-S97.82, T92.6, T93.6	906.4, 925-928.9, 929.9
Crush injury	S04-S04.9, S14.2-S14.9, S24.2-S24.9, S34.2-S34.9, S44-S44.92, S54-S54.92, S64-S64.92, S74-S74.92, S84-S84.92, S94-S94.92, T1.3, T1.3.3, T90.3, T92.4, T93.4	907.1, 907.3-907.9, 950-951.9, 953-957.9
Nerve injury	H26.1-H26.139, S01.1-S01.159, S05-S05.92, T14.4, T15-T15.92, T26-T26.92, T90.4	366.2-366.23, 870-871.9, 918-918.9, 921-921.9, 930-930.9, 940-940.9
Injury to eyes	S78-S78.929, S88-S88.929, S98-S98.029, S98.3-S98.929	896-896.1, 897-897.5
Amputation of lower limb, unilateral	S01-S01.05, S01.2-S01.95, S08-S09.399, S10, S10.7, S11, S11.1-S11.15, S11.8-S11.95, S15-S15.9, S21-S21.95, S31-S31.8, S39, S39.7, S41-S41.8, S45-S45.999, S51-S51.9, S55-S55.999, S61-S61.9, S65-S65.999, S71-S71.8, S75-S75.999, S81-S81.9, S85-S85.999, S91-S91.7, S95-S95.999, T01-T01.9, T09.1, T11.1, T11.4, T11.5, T13.1, T13.4, T13.5, T14.1, T14.5, T14.6, T90.1, T92.0, T92.5, T93.0	872-873.9, 874.2-884.2, 890-894.2, 900-900.9, 903-904.9, 906-906.2
Open wound(s)	T36-T65.94, T96-T97.0	960-989.9
Poisoning requiring urgent care	S11.0-S11.039, S11.2-S11.7, S25-S28.229, S29.7-S29.9, T91.4	807.05, 807.06, 860-862.9, 874-874.12, 901-901.9, 908.0
Severe chest injury	S35-S37.99, S39.8-S39.848, T79-T79.9, T91.5	863-869.1, 902-902.9, 908.1-908.3
Internal hemorrhage in abdomen and pelvis	S20-S20.02, S20.2-S20.229, S30-S30.3, S40-S40.2, S50-S50.12, S60-S60.9, S70-S70.2, S80-S80.7, S90-S90.4	906.3, 920, 922-924.9
Contusion in any part of the body	T33-T35.7, T66-T70.9, T75-T75.09, T75.2-T75.89, T95.8, T95.9	990-994.0, 994.2-994.6, 994.8, 994.9
Effect of different environmental factors	T80-T88.9	995.4, 996-996.99, 998-999.39, 999.6-999.9
Complications following therapeutic procedures	S00-S00.97, S10.0-S10.17, S10.8-S10.97, S20.1-S20.179, S20.3-S20.97, S30.7-S30.98, S40.21-S40.929, S50.3-S50.919, S70.21-S70.929, S80.8-S80.929, S90.41-S90.936, T00-T00.9, T09.0, T1.0, T13.0, T14.0, T90.0	910-917.9, 919-919.9
Superficial injury of any part of the body	T02-T02.9, T04-T04.9, T06-T07.0	817-819.1, 827-828.1, 929.0
Multiple fractures, dislocations, crashes, wounds, lacerations, and strains	F07.2-F08, G44.3-G44.309, G44.32-G44.329, G91.3	339.2
Long term sequelae for TBI
