3

4 Storage and Robotic Array of Metagenomic Clones in 384 Well Microplates

5 Metagenomic clones from the CD and HC libraries were directly plated on Luria broth (LB) agar supplemented
6 with 15 µg/ml tetracycline. Clones were individually selected using a colony picker (CP7200 Hudson) and
7 placed into wells of a 384 well microplate containing LB medium (tetracycline 15 µg/ml). Negative control
8 clones (*E. coli* EC100 cells containing the pJWC1 cosmid vector) were plated into columns 2 and 11 of the
9 microplate. Plates were grown overnight at 37 °C, glycerol was added to a final concentration of 25% and
0 plates were stored at -80 °C. Metagenomic clones from the UC patient library clones were arrayed using a
1 liquid dispensing robot (Multidrop™ Thermoscientific). An overnight culture was diluted to ~1-3 clones per 100
2 µl of media and 100 µl of media was dispensed into each well of the microplate well. Microplates were stored
3 at -80 °C in the same fashion as the other libraries.

4

5 Z' for NF-κB Reporter Cells

6 HEK293:NF-κB:GFP cells were tested for robustness of NF-κB induced GFP expression using TNF α
7 (Invitrogen) as a positive control and the TNF α activation inhibitor CAPE (caffeic acid phenethyl ester, Santa
8 Cruz Biotech). Cells were incubated with TNF α or TNF α + CAPE for 24h and imaged using ImageXpress
9 Micro XLS Widefield High Content Imaging System (Molecular Devices). Images were processed using
0 MetaXpress (Molecular Devices) and the percent of cells showing GFP expression was calculated on a per
1 well basis (Fig S5). At 10 ng/ml TNF α the near maximum GFP expression was observed. CAPE was added
2 at different concentrations to wells containing 10 ng/ml TNF α. The maximum inhibition of TNF α mediated
3 GFP expression was observed at a concentration of 10 µg/ml CAPE. At these concentrations the mean
4 percent GFP expression of the TNF α positive control group was 74.1 with a standard deviation of 2.76. With
5 the addition of 10 µg/ml CAPE the mean percent GFP expression was 24.3 with a standard deviation of 5.01.
6 The Z prime score based on these values is 0.61 (Fig S5). (1)

7

8 16s PCR Analysis and Data Processing

1 100 ng of cosmid clone DNA from each of the three patient libraries was mixed with 0.5 μM primers, 1x Buffer
2 G (Epicentre), 0.2 U Phusion polymerase, 2.5U rTaq polymerase (New England Biolabs), 3% DMSO. Primers
3 targeting the V4 rRNA region were used (F primer - 5'AYTGGYDTAAGNG, R primer -
4 5'TACNVGGGTATCTAATCC). (2) 454 sequencing adapters and unique barcodes were attached for
5 processing and sample identification. PCR conditions were 25 cycles of 10s at 98 °C, 30s at 55 °C, 30s at 72
6 °C followed by an extension step for 5min at 72 °C. PCR reactions were run on crystal violet stained gels and
7 amplicons of the correct size were gel purified (Qiagen MinElute). Purified PCR products were fluorometrically
8 quantified (PicoGreen Quant-iT, Invitrogen) and analyzed via capillary electrophoresis (DNA 7500; Agilent
9 Technologies). Each sample was diluted to ~10⁹ molecules/μL. All samples were pooled for emulsion PCR
0 and pyrosequenced (454 GS-FLX Titanium). Raw 454 reads were processed using QIIME. (3) The general
1 workflow is summarized as follows: 1) sequences were denoised and quality filtered. 2) OTUs were assigned
2 at 97% identity and representative sequences identified in each OTU. 3) Each OTU representative sequence
3 was assigned taxonomy using Greengenes. 4) Per patient sample OTU tables were summarized by taxonomy
4 and diversity statistics calculated.

5

6 Subcloning of Cbeg12-1

7 The following primers were used to PCR amplify the Cbeg12-1 gene from cosmid Cbeg12 (35i19): F primer -
8 GATCAGTACTGCTTGGTAAACAGGGAGGTTT R primer - GATCAGTACTTATTGGTCAGTATGGGAT. The
9 resulting PCR product was digested with Scal and ligated into Scal digested pJWC1 vector.

0

1 Isolation of N-acyl amino acids from Cbeg 12

2 *E. coli* transformed with the Cbeg12-1 (35i19) cosmid was and a negative control culture (*E. coli* EC100 with
3 empty pJWC1 cosmid vector) were grow in LB medium supplemented with tetracycline (15 μg/ml) (4 days, 250
4 rpm, 30 °C). Both cultures were extracted with ethyl acetate 1:1 and the resulting extracts were dried in vacuo.
5 Extracts were fractionated by silica gel flash column chromatography (chloroform:methanol (0.1% TFA): 99:1
6 isocratic for 5 min, gradient from 99:1 to 70:30 over 10 min). Similar fractions were combined based on TLC
7 analysis and then combined fractions were assays for ability to induced GFP expression in HEK293:NF-
8 kB:GFP cells (Fig S4). Only the combined fraction containing clones specific metabolites was found to induce

1 GFP. Compounds **1-4**, which were not seen in the corresponding fraction from the vector control culture, were
2 purified from this Cbeg12-1 fraction using reversed phase HPLC (Waters XBridgeTm C₁₈, 10 X 250 mm, 3
3 ml/min, isocratic 70% acetonitrile with 0.1% TFA) (Fig S4). Purified **1-4** were resuspended in DMSO and
4 assayed for the ability to induce GFP expression in HEK293:NF-κB:GFP cells.

5

6 Structure determination of compounds **1 - 4**

7 NMR spectroscopic data for naturally isolated compounds **1 – 4** appears in Figure S6, Table S3.

8

9 Structures of compounds **1 – 4** were determined by spectroscopic analysis including MS, and 1D and 2D NMR.
0 Compound **1** was isolated as the major compound. HRMS calculated for compound **1** C₁₈H₃₆NO₅⁺ 330.26,
1 found: 330.2859. The odd molecular weight suggested that compound **1** contains an odd number of nitrogens.
2 Analysis of the ¹H NMR spectrum of **1** in combination with DEPT-Q and HSQC spectra indicated the presence
3 of NH (δ_{H} 8.23, t), oxygenated methine (δ_{H} 3.78), two diastereotopic methylene (δ_{H} 3.78 and 3.85; δ_{H} 2.19 and
4 2.23) and largely overlapped aliphatic methylene (δ_{H} 1.24) and methyl (δ_{H} 3.78 and 3.85) protons. Analysis of
5 the COSY spectrum identified the presence of two separate spin systems. A COSY correlation between NH
6 and diasterotopic protons (H₂-2) together with an HMBC correlation from H₂-2 protons to a carbonyl carbon C-1
7 suggested that the first spin system arises from a glycine moiety. The presence of a fatty acid moiety was
8 apparent due to the appearance of a large methylene envelope at 1.24 ppm as well as a triplet methyl signal
9 (H₃-18, δ_{H} 1.85). Sequential COSY correlations were observed between H₂-4/H-5/H₂-6/H₂-7, and COSY
0 correlations between H-5 and OH indicated H-5 to be hydroxylated. In the COSY spectrum H2-7 further
1 correlated with the largely overlapped aliphatic signals at 1.24 ppm, deducing the second spin system as a
2 hydroxylated fatty acid moiety. The glycine and hydroxylated fatty acid moiety can be combined through an
3 amide bond based on HMBC correlations from H₂-2 and NH to C-3, suggesting compound **1** to be an *N*-acyl
4 glycine. Finally, the length of a fatty acid moiety was determined as C18 based on the predicted molecular
5 formula. Thus, the structure of **1** was determined to be 3-OH-*N*-palmitoyl glycine.

6

7 HRMS calculated for compound **2** C₁₈H₃₄NO₅⁺ 328.24, found: 328.2657. The ¹H and ¹³C NMR spectra of **2** are
8 almost identical to those of **1** except for the presence of signals for double bonds in the spectra of **2**. The

1 molecular weight difference of two suggested the same carbon chain length between compounds **1** and **2**.
2 COSY correlations between H-11/H-12 and H-10/H-13, and between H-10/H-13 and a largely overlapped
3 methylene signals indicated that a double bond is located on a fatty acid chain. The position of the double
4 bond was not be determined by a spectroscopic methods. The position of the double bond is predicted based
5 on the position that is most frequently seen in *E. coli* lipids and has been seen in all previous *N*-acyl amino
6 acids characterized produced by *E. coli*. (4)

7

8 HRMS calculated for compound **3** $C_{20}H_{38}NO_5^+$ 356.27, found: 356.2975. The 1H NMR spectrum of **3** is similar
9 to that of **2** except for the integration of the methylene envelope at δ_H 1.24. The ^{13}C NMR spectrum of **3**
0 displayed additional signals around δ_C 29.0. This together with a molecular weight difference of twenty eight
1 indicated a fatty acid moiety of **3** to be a 3-hydroxylated oleic acid (C18:1) instead of a 3-hydroxylated palmitic
2 acid that is seen in **2**.

3

4 HRMS calculated for compound **4** $C_{16}H_{32}NO_5^+$ 302.23, found: 302.2501. The 1H spectrum of **4** is similar to that
5 of **1**, however the integration of methylene envelope. The molecular weight difference of twenty-eight between
6 **1** and **4** suggested the fatty acid moiety of **4** as a 3-hydroxylated myristic acid instead of a 3-hydroxylated
7 palmitic acid found in **1**.

8

9 HEK293:NF- κ B:GFP bioassay of purified *N*-acyl-glycines

0 Each purified clone specific metabolite was resuspended at 0.45 mg/25 μ l methanol. 1 μ l of this dilution was
1 added to 80 μ l of sterile spent culture media from negative control clones and the mixture was added to 100 μ l
2 of HEK239:NF- κ B:GFP reporter cells in a 96-well microplate (8,000 cells per well). Each purified compound (**1**
3 - **4**) was assayed at 100 μ g/ml in the first well of microtiter plate and then serially diluted (two fold/well) across
4 the plate. GFP expression was monitored in the same fashion as described above.

5

6 *Bacteroides vulgatus* ATCC 8482 culture broth analysis

7 *B. vulgatus* was purchased from ATCC and grown for 14 days under anaerobic conditions in LY-BHI media.
8 The mature *B. vulgatus* culture was extracted 1:1 with ethyl acetate under neutral and acidic conditions (pH 2-

1 3). Crude extracts were separated by reversed phase flash chromatography [water:methanol gradient 80:20 to
2 0:100 (0.1% TFA)]. Fractions were analyzed by reversed phase LCMS (Waters XBridgeTM) using a binary
3 solvent system (A/B: water/acetonitrile with 0.1% formic acid) from 5% solvent B to 95% solvent B over 40
4 minutes. Purified **1** was run under the same conditions as a control.

5

6 Synthesis of N-acyl amino acid derivatives

7 Glycine was purchased from Fisher Scientific Inc. (Waltham, MA). (Benzotriazol-1-yloxy)
8 tripyrrolidinophosphonium hexafluorophosphate (PyBOP) and 6-Chloro-1-hydroxybenzotriazole (Cl-HOBt)
9 were purchased from Peak Polypeptide Biosystems (Louisville, KY). All other reagents and solvents were
0 purchased from Sigma-Aldrich (St. Louis, MO).

1

2 **N-(3-hydroxypalmitoyl)glycine.** This compound was synthesized based on the same procedure as described
3 for **1**. The desired product eluted at 76% solvent B and 0.7mg of purified material was obtained after
4 lyophilization. NMR ($\text{CD}_3\text{OD}-d_4$): δ 0.90 (3H, t, J = 7.1 Hz), 1.1 ~ 1.3 (22H, m), 1.4 ~ 1.5 (4H, m), 2.33 (2H, dd,
5 J = 14.2, 8.4 Hz), 2.38 (2H, dd, J = 14.2, 4.3 Hz), 3.80 (1H, d, 17.4 Hz), 3.96 (1H, m). HRMS calculated for
6 $\text{C}_{18}\text{H}_{36}\text{NO}_5^+$ 330.26, found: 330.2550

7

8 **N-(3-hydroxydecanoyl)glycine.** This compound was synthesized based on the same procedure as described
9 for **1**. The desired product eluted at 43% solvent B and 0.9mg of purified material was obtained after
0 lyophilization. ^1H NMR ($\text{CD}_3\text{OD}-d_4$): δ 0.90 (3H, t, J = 7.2 Hz), 1.1 ~ 1.3 (8H, br), 1.4 ~ 1.5 (4H, m), 2.30 (2H,
1 dd, J = 14.1, 8.5 Hz), 2.37 (2H, dd, J = 14.1, 4.0 Hz), 3.77 (1H, d, 17.4 Hz), 3.96 (1H, m). HRMS calcd for
2 $\text{C}_{12}\text{H}_{24}\text{NO}_5^+$ 246.16, found: 246.1530

3

4 **N-(3-hydroxypalmitoyl)tyrosine.** dl-3-Hydroxypalmitic acid (10.0 mg, 37 μmol) was dissolved in 400 μL of
5 anhydrous DMF and activated by PyBOP (19.1 mg, 37 μmol), Cl-HOBt (6.2 mg, 37 μmol), and DIPEA (37 μL , 2
6 M solution in NMP) for 10 min. The activated fatty acid was added to a solution of tyrosine (13.3 mg, 74 μmol)
7 in 400 μL DMF premixed with DIPEA (74 μL , 2 M solution in NMP) and shaken at 200 rpm in a 37 °C incubator
8 for 16 h. After removal of solvent by speed-vacuum, the resulting material was dissolved in methanol and

1 purified by HPLC using a binary solvent system (A/B: water/acetonitrile containing with 0.1% formic acid). The
2 desired product eluted at 76% solvent B and 0.4mg of purified material was obtained after lyophilization. ^1H
3 NMR ($\text{CD}_3\text{OD}-d_4$): δ 0.90 (3H, t, J = 7.1 Hz), 1.1 ~ 1.3 (22H, br), 1.4 ~ 1.5 (4H, m), 2.26 (2H, m), 2.85 (1H, m),
4 3.11 (1H, m), 3.85 (1H, m), 4.50 (1H, m), 6.66 (2H, d, J = 8.1 Hz), 7.05 (2H, d, J = 8.1 Hz). HRMS calcd for
5 $\text{C}_{25}\text{H}_{42}\text{NO}_5^+$ 436.3057, found: 436.2973

6

7 **GPCR Screen**

8 Commendamide (natural and synthetic), natural products **2** and **4** and all synthesized acyl amide derivatives
9 were resuspended at 10 mM in DMSO and sent to DiscoveRx for assay. Assays were performed per
0 DiscoveRx. Initial screen against GPCR library was done only with commendamide at 10 μM concentration.
1 After identification of GPR 132/G2A activation by commendamide, other acyl amides were similarly screened
2 for G2A receptor activation.

7 **Figure Legends:**

8 2 **Fig. S1. ppGpp synthetase.** Nine different effector genes are predicted to be ppGpp synthetases. (A) Effector
9 gene protein sequences were aligned to each other with MUSCLE (Macvector). ppGpp synthetase genes
0 have varying degrees of identity to each other. (B) A phylogenetic tree prepared of effector genes using the
1 UPMGA method and bootstrapped 999 times. ppGpp synthetase genes cluster according to species.
2

3

1
2 **Fig. S2. Additional analysis of Cbeg4, 5, and 6/7** (A) Predicted protein sequences for Cbeg4 and 5 were
3 analyzed by SignalP (5). Both protein sequences are predicted to have type 1 signal peptides. (B) Cbeg6/7
4 exists as a 2 gene operon where interruption of either gene inhibits the GFP expression phenotype. Structural
5 analysis of Cbeg6 predicts 7 transmembrane helices (THMM v2.0). Genes from the reference genome
6 *Roseburia intestinalis* are similar to Cbeg6/7 and arranged in the same 2 gene operon.
7

8 **Fig. S3. Cbeg12 phylogenetic characterization.** (A) An alignment of the three Cbeg12 genes identified.
9 Protein sequences were aligned with MUSCLE and visualized with Macvector (B) Both Cbeg12 and soil
0 derived N-acyl synthase genes are related to enzymes from the PFAM acetyltransferase-5 family (PF13444).
1 Alignment of all 1571 sequences in this PFAM domain (1299 species total) including Cbeg12 and the known
2 soil N-acyl synthases was performed with ClustalW. Phylogenetic tree visualization by iTOL. Cbeg12 is in a
3 distinct clade relative to soil N-acyl synthase genes.
4

5 **Fig. S4. Bioassay (HEK293:NF-kB:GFP) guided purification of compounds 1- 4.** (A) Cbeg12-1 gene was
6 subcloned into the pJWC1 vector and transformed in *E. coli* EC100. The Cbeg12 gene alone was sufficient to
7 induce GFP expression in HEK293:NF-kB:GFP cells. (B) Normal phase TLC analysis of all column fractions
8 from Cbeg12-1 and empty vector control extracts (85:15 chloroform:methanol). Flash chromatography fractions
9 were combined into 4 groups as indicated. (C) Bioassay data for combined fractions from Cbeg12 and
0 negative control (NC) extracts. Cbeg12 clone specific metabolites are present in Fraction 2 which activates the
1 293:NF-kB:GFP reporter cells. Fractions 1 from both Cbeg12 and NC exhibit significant toxicity and contain no
2 clone specific metabolites. (D). Bioassay data for purified clone specific compounds **1-4**.
3

4 **Fig. S5. Z prime calculation and 384-well microplate layout.** (A) Z prime was calculated for HEK293:NF-
5 kB:GFP reporter cells using known agonists (TNF α) and antagonists (CAPE – caffeic acid phenethyl ester).
6 At 10 ng/ml TNF α begins to saturate the response of the HEK293:NF-kB:GFP cells. At this TNF α
7 concentration CAPE can inhibit TNF α mediated activation of HEK293:NF-kB:GFP reporter cells at a maximal
8 CAPE concentration of 10 μ g/ml. (B) Using the population statistics for activation (TNF α 10ng/ml) or inhibition

1 (CAPE 10 µg/ml) of HEK293:NF-kB:GFP cells (Table) a Z prime score is calculated with a value of 0.61. (C)
2 Each microplate was arranged as outlined. The yellow column contained 10 ng/ml of TNF α to ensure
3 HEK293:NF-kB:GFP cells continued to respond to stimuli by visual inspection. Blue columns are negative
4 controls and the red line shows excluded wells due to poor reproducibility of edge wells.

7 simple clinical colitis index (UC).
8 *All patients were free of abdominal surgery and antibiotic use > 6 months
9

1 **Table S2**

2
3 **Table S2A. Cosmid and Cbeg sequence analysis.** Each unique cosmid and the effector gene(s) on that
4 cosmid were independently aligned to the NCBI reference genome dataset using BlastN. For each unique
5 cosmid (blue column) and effector gene (red column) the most similar reference genome is recorded. Each
6 effector gene protein sequence was then aligned to the NCBI nr dataset (BlastP) to identify conserved domains
7 (green column). Conserved domains are presented in descending order (N to C terminus of predicted protein)
8 starting with conserved multidomains followed by individual domains.

- 1 **Table S2C. Swissprot analysis.** Each effector gene was aligned to the Swissprot database using ngKlast.
 2 The top Swissprot hit is recorded along with the e value, percent identity (over the full effector gene), percent
 3 identity (over the portion aligned), and taxonomy.
