

SUPPLEMENTAL MATERIAL

Supplemental Table 1. Area under the TTNT curve for good neurological outcome according to the results of each neurological examination

Neurological examination	Test result	Area (95% CI) under the TTNT curve for neurological outcome
Pupil light reflex (n=111)	Positive (n=44)	0.943 (0.829-0.990)
	Negative (n=67)	0.994 (0.934-1.000)
Corneal reflex (n=110)	Positive (n=32)	0.919 (0.766-0.985)
	Negative (n=78)	0.984 (0.925-0.999)
Spontaneous breathing (n=93)	Positive (n=66)	0.967 (0.891-0.996)
	Negative (n=27)	1.000 (0.872-1.000)
Motor response* (n=111)	Positive (n=23)	1.000 (0.852-1.000)
	Negative (n=88)	0.979 (0.923-0.998)

TTNT, time to normal trace; CI, confidence interval.

*: Positive motor response was defined as Glasgow Coma Scale-motor grade > 2

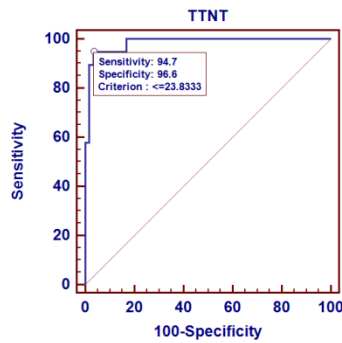

(A-1) PLR + patients (n=44)

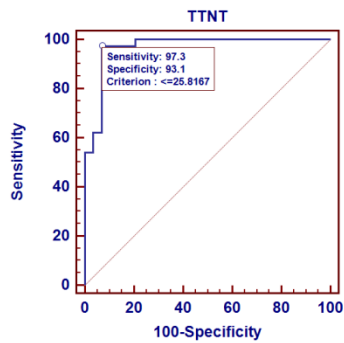

(A-2) PLR - patients (n=67)

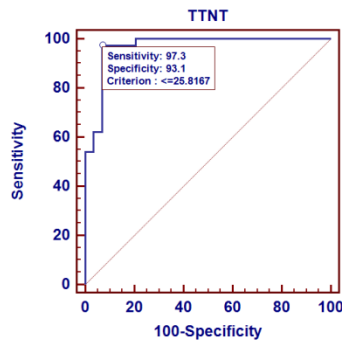

(B-1) CR + patients (n=32)

(B-2) CR - patients (n=78)

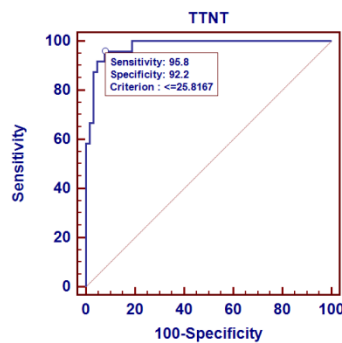

(C-1) SB + patients (n=66)

(C-2) SB - patients (n=27)

(D-1) MR + patients (n=23)

(D-2) MR - patients (n=88)

Supplemental Figure 1. Receiver operating characteristic curve for the prediction of neurological outcome according to the time to normal trace for each category of the initial degree of coma. PLR, pupillary light reflex; CR, corneal reflex; SB, spontaneous breathing; MR, motor response.
