^aLilliefors significance correction.^bShapiro-Wilk test: if sig. >0.05, the data are normal distribution. If it is below 0.05, the data significantly deviate from a normal distribution.^cThis is a lower bound of the true significance.

GFA, generalized fractional anisotropy; M1, primary motor area; PMd, premotor dorsal area; PMv, premotor ventral area; SC, somatosensory cortex; SMA, supplementary motor area.
