## SUPPLEMENTARY FIGURES/FIGURE LEGENDS

**Figure S1: K<sub>i</sub> values for 7-Cl-KYNA against a panel of receptors.** Data represent K<sub>i</sub> (μM) values obtained from non-linear regression of radioligand competition binding isotherms. K<sub>i</sub> values are calculated from best fit IC<sub>50</sub> values using the Cheng-Prusoff equation. Data are the mean ± SEM (n=4/group in each experiment).

**Figure S2:  $K_i$  values for 4-Cl-KYN against a panel of receptors.** Data represent  $K_i$  ( $\mu\text{M}$ ) values obtained from non-linear regression of radioligand competition binding isotherms.  $K_i$  values are calculated from best fit  $\text{IC}_{50}$  values using the Cheng-Prusoff equation. Data are the mean  $\pm$  SEM ( $n=4$ /group in each experiment).

All experiments were binding assays performed by PDSP. % values are the mean of 4 replicates and were derived from single concentration (10 $\mu$ M). Negative values are represented as 0% here. K<sub>i</sub> values ( $\mu$ M; in bold) were determined from full concentration curves only for receptors displaying >50% inhibition.
