

Supplemental Data Fig. S1. Scatterplots showing the correlation between the plasma concentration of small dense LDL cholesterol (sdLDL-C) (A) or the sdLDL-C/LDL-C ratio (B) and the homeostasis model assessment of insulin resistance (HOMA-IR) in patients with MetS (●) and healthy population (○). Linear regression curve for the two variables are indicated in solid line (for patients with MetS) or dashed line (for healthy population).
