Table S2. Data used for linear model based on BLAST-analysis of cancer genes. Body mass data [1, 2] and the evolutionary distance from humans was taken from the literature [3-7]. ONC: oncogene; CT: caretaker; GK: gatekeeper; MRCA: most recent common ancestor with homo sapiens.

Table S3. Matrix of 830 Tumor Suppressor Genes used in Copy Number Analysis and the Number of Copies found in each of the 36 Mammals. Each row is a gene and each column is a mammalian species (see separate ESM file).

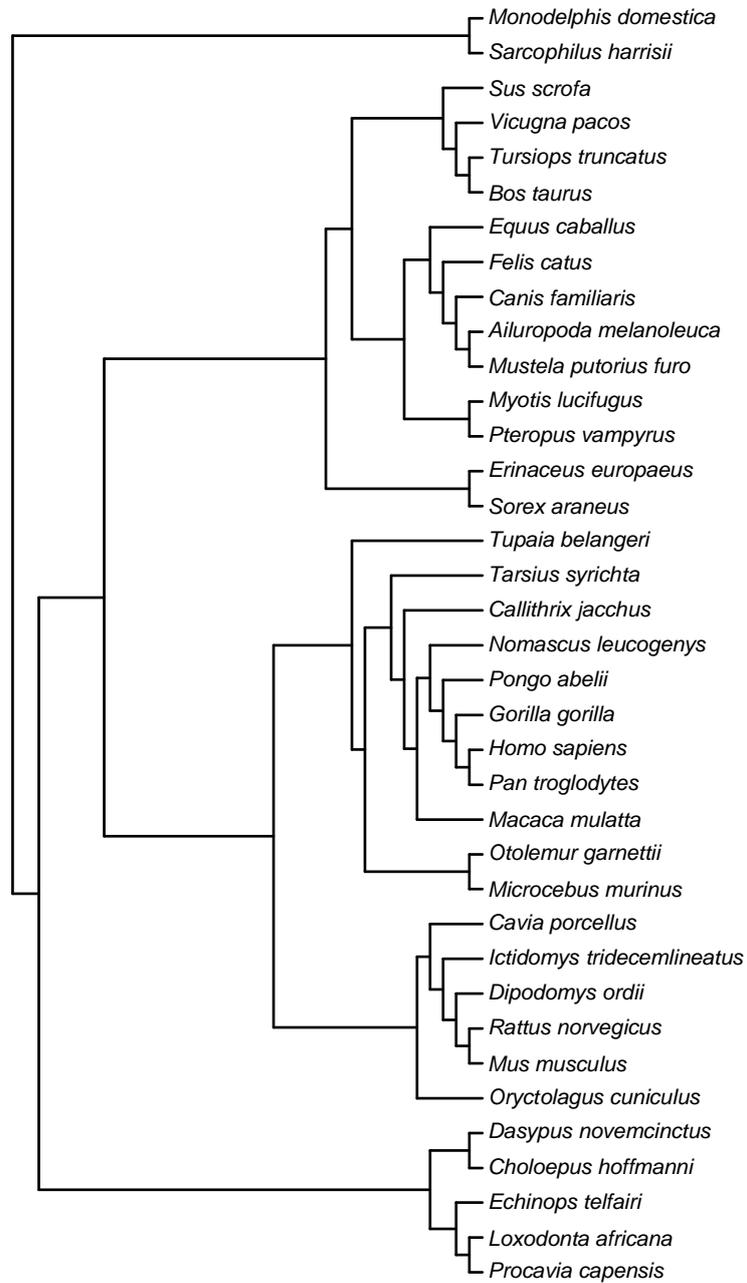

Figure S1. Phylogeny of 36 mammalian species used in the copy number of cancer genes analysis. The newick file of the phylogeny for all species in Ensembl was downloaded from Ensembl's gitHub repository (release 79) and plotted with the *ape* package in R. Species that were not used in this analysis but were in the Ensembl tree file were removed from the tree. *Homo sapiens* are shown for context.
