Supplementary Information

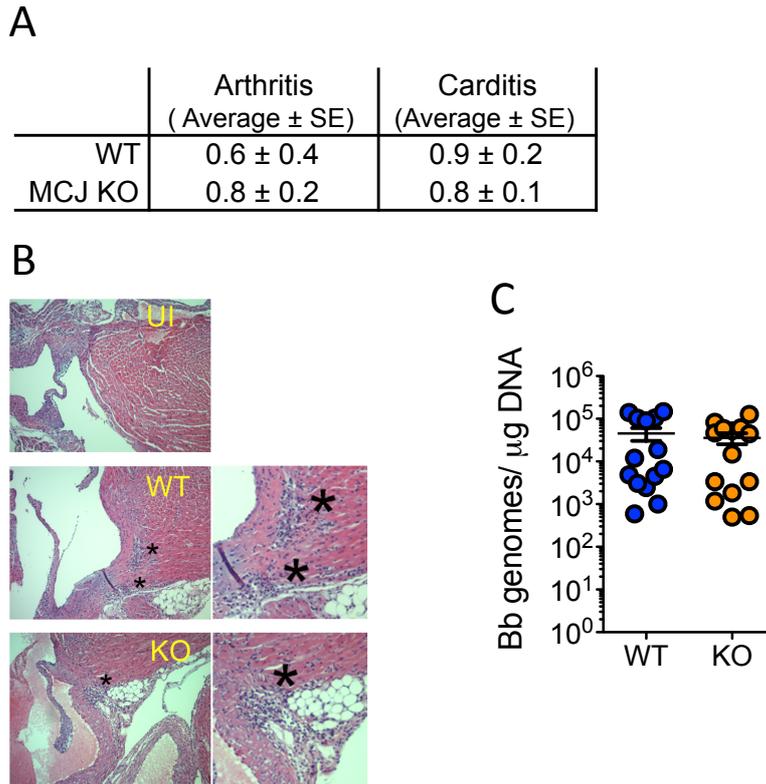

Figure S1. MCJ KO mice develop similar levels of inflammation than WT controls upon infection with *B. burgdorferi*. (A) Levels of arthritis and carditis \pm SE in 3 week infected MCJ KO and WT control mice. The mice, in groups of 5, were infected with 10^5 *B. burgdorferi* subcutaneously. Arthritis and carditis were determined blindly in tissue sections processed as described in Methods. (B) Photomicrographs showing representative cardiac sections of uninfected (UI) and infected wild type (WT) or MCJ KO mice. Foci of inflammation are marked by asterisks. (C) Total DNA was extracted from the base of the heart of uninfected or WT and MCJ KO infected mice and spirochetal burdens were determined by real-time PCR as described in Methods. The results represent the mean of 5-15 mice in 3 different experiments.

Figure S2. Identification of putative Ikaros binding sites on the MCJ promoter. Sequence of the 1kb proximal MCJ promoter identifying 2 Ikaros binding sites (in green). The primers used to clone the promoter are shown in red. The primers utilized for the amplification of immunoprecipitated chromatin are marked in bold at both sides of each binding site (Table S1).

Table S1. Primers used and their purpose.
