

S1 Fig.

S1 Fig. Early increase in serum urea and creatinine concentrations after unilateral (left) I/R. Urea and creatinine were determined (Labtest Diagnóstica kit) in serum from Sham mice 72 h after the surgical intervention, and in I/R mice at the times indicated on the abscissa. Data are mean \pm SD; number of mice within the bars. * $P < 0.05$ when compared to the corresponding Sham (one way ANOVA followed by Bonferroni post-test for selected pairs).
