

SUPPLEMENTARY FIGURE AND TABLE

Supplementary Figure S1: The prognostic impact of median age at diagnosis (<63 y/ ≥ 63 y) was analyzed for the entire GBM patient cohort **A. A significantly reduced OS was shown for older patients (>63 years) $p = 0.05$. The impact of the *TERT* promoter mutation status on patient OS was analyzed in age stratified patient subgroup **B**. & **C**. A significantly reduced OS was observed in the subgroup older than 63 years ($p = 0.02$).**

Supplementary Table S1: *TERT*, *POT1* and *IDH1/2* primers

	Forward primer	Reverse primer
