## Part I: Computational Studies

### 1 Computational Details

For the computational investigations, the conformational space for each structure was explored using the OPLS-2005 force field<sup>1</sup> and a modified Monte Carlo search algorithm implemented in MacroModel 10.6.<sup>2</sup> An energy cut-off of 20 kcal mol<sup>-1</sup> was employed for the conformational analysis, and structures with heavy-atom root-mean-square deviations (RMSD) less than 2 Å after the initial force field optimizations were considered to be the same conformer. The remaining structures were subsequently optimized with the dispersion-corrected M06-L functional<sup>3</sup> with Grimme's dispersion-correction D3<sup>4</sup> and the double- $\zeta$  basis set 6-31+G(d,p). Solvation by toluene was taken into account by using the integral equation formalism polarizable continuum model (IEFPCM)<sup>5</sup> for all calculations. Vibrational analysis verified that each structure was a minimum or transition state. Following the intrinsic reaction coordinates (IRC) confirmed that all transition states connected the corresponding reactants and products on the potential energy surface. Thermal corrections were obtained from unscaled harmonic vibrational frequencies at the same level of theory for a standard state of 1 mol L<sup>-1</sup> and 298.15 K. Entropic contributions to the reported free energies were derived from partition functions evaluated with the quasiharmonic approximation by Truhlar and coworkers.<sup>6</sup> Electronic energies were subsequently obtained from single point calculations of the M06-L-D3 geometries employing the meta-hybrid M06-2X functional,<sup>7</sup> Grimme's dispersion-correction D3 (zero-damping), the large quadruple- $\zeta$  basis set def2-QZVP,<sup>8</sup> and IEFPCM for toluene, a level expected to give accurate energies.<sup>9</sup> An ultrafine grid was used throughout this study for numerical integration of the density. All density functional theory calculations were performed with Gaussian 09.<sup>10</sup>

## Crystal Structure for Compound 6c

Compound **6c** was recrystallized from methanol and dichloromethane.

The ellipsoid contour probability level for the thermal ellipsoid plot is 50%.

## Crystal Structure for Compound **8c**

Compound **8c** was recrystallized from dichloromethane and pentane.

The ellipsoid contour probability level for the thermal ellipsoid plot is 50%.
