

Figure S3

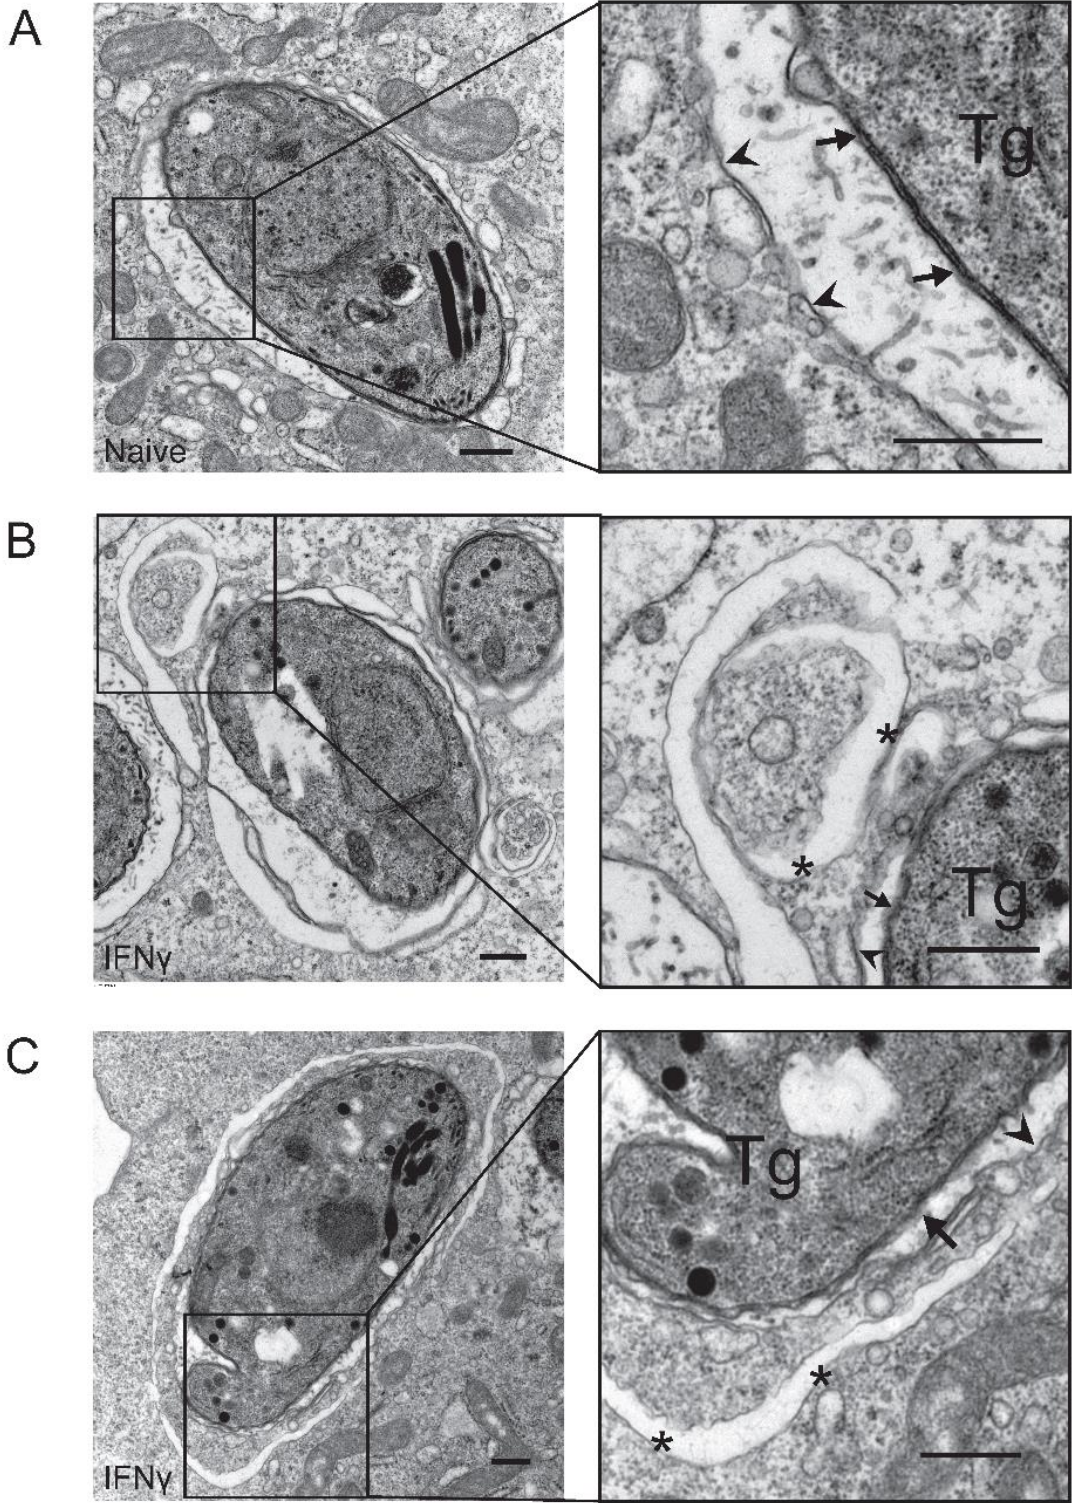

FIG. S3. PVs were enclosed in multiple membranes in IFN γ -activated cells. Related to FIG. 3

A) Transmission electron microscopy reveals the normal architecture of the PVM of a type 3 (VEG) parasite in a naïve HeLa cell at 6 hr post infection. B) C) Additional membranes surround the PVM of a type 3 (VEG) parasite in HeLa cells activated with 5 ng/ml of IFN γ at 6 hr post infection. Arrow indicates parasite membrane, arrowhead indicates PVM, asterix indicates additional membranes. Scale bars = 500 nm.
