

Supplemental Figures and Tables

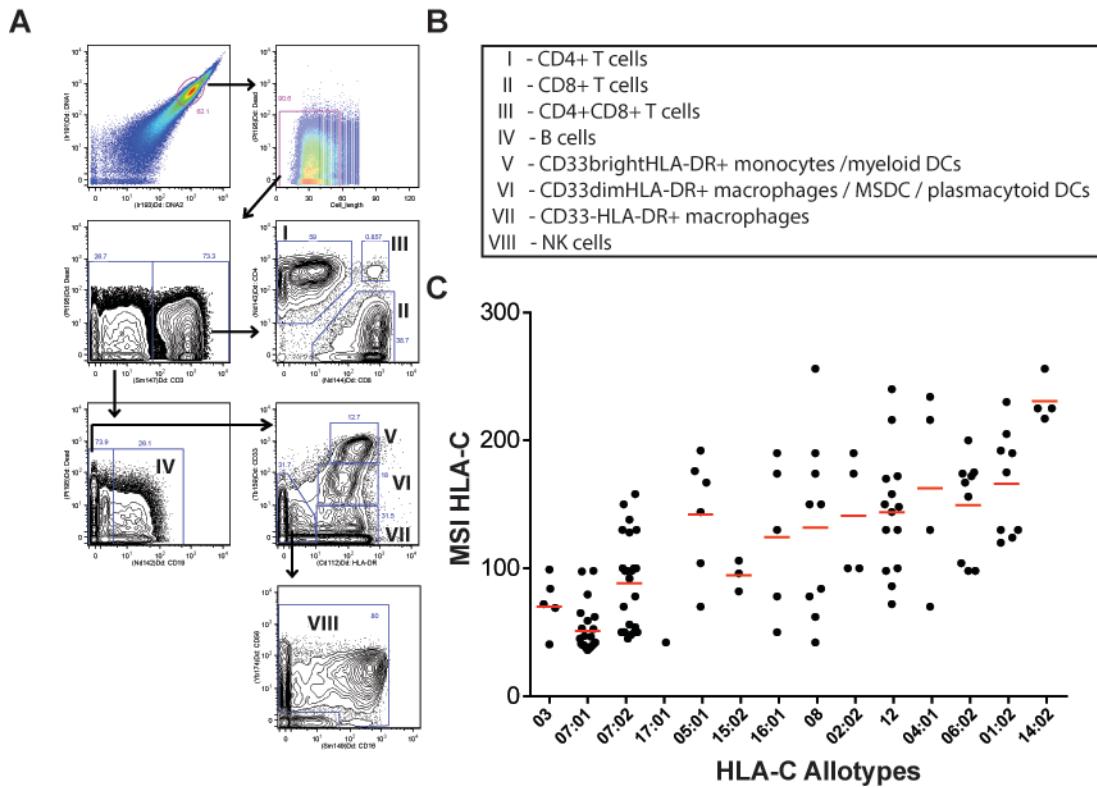

Fig. S1. Gating strategy for major cell lineages in PBMC. (A) Representative 2D CyTOF plots demonstrating gating strategy for defining major leukocyte populations in PBMC. Roman numerals correspond to (B) description of gated subset populations. (C) Cell-surface density (MSI) of HLA-C on unfractionated PBMC in healthy CMV-negative controls across different HLA-C allotypes. Each individual is plotted two times, one for each HLA-C allele. Red bars represent mean values.

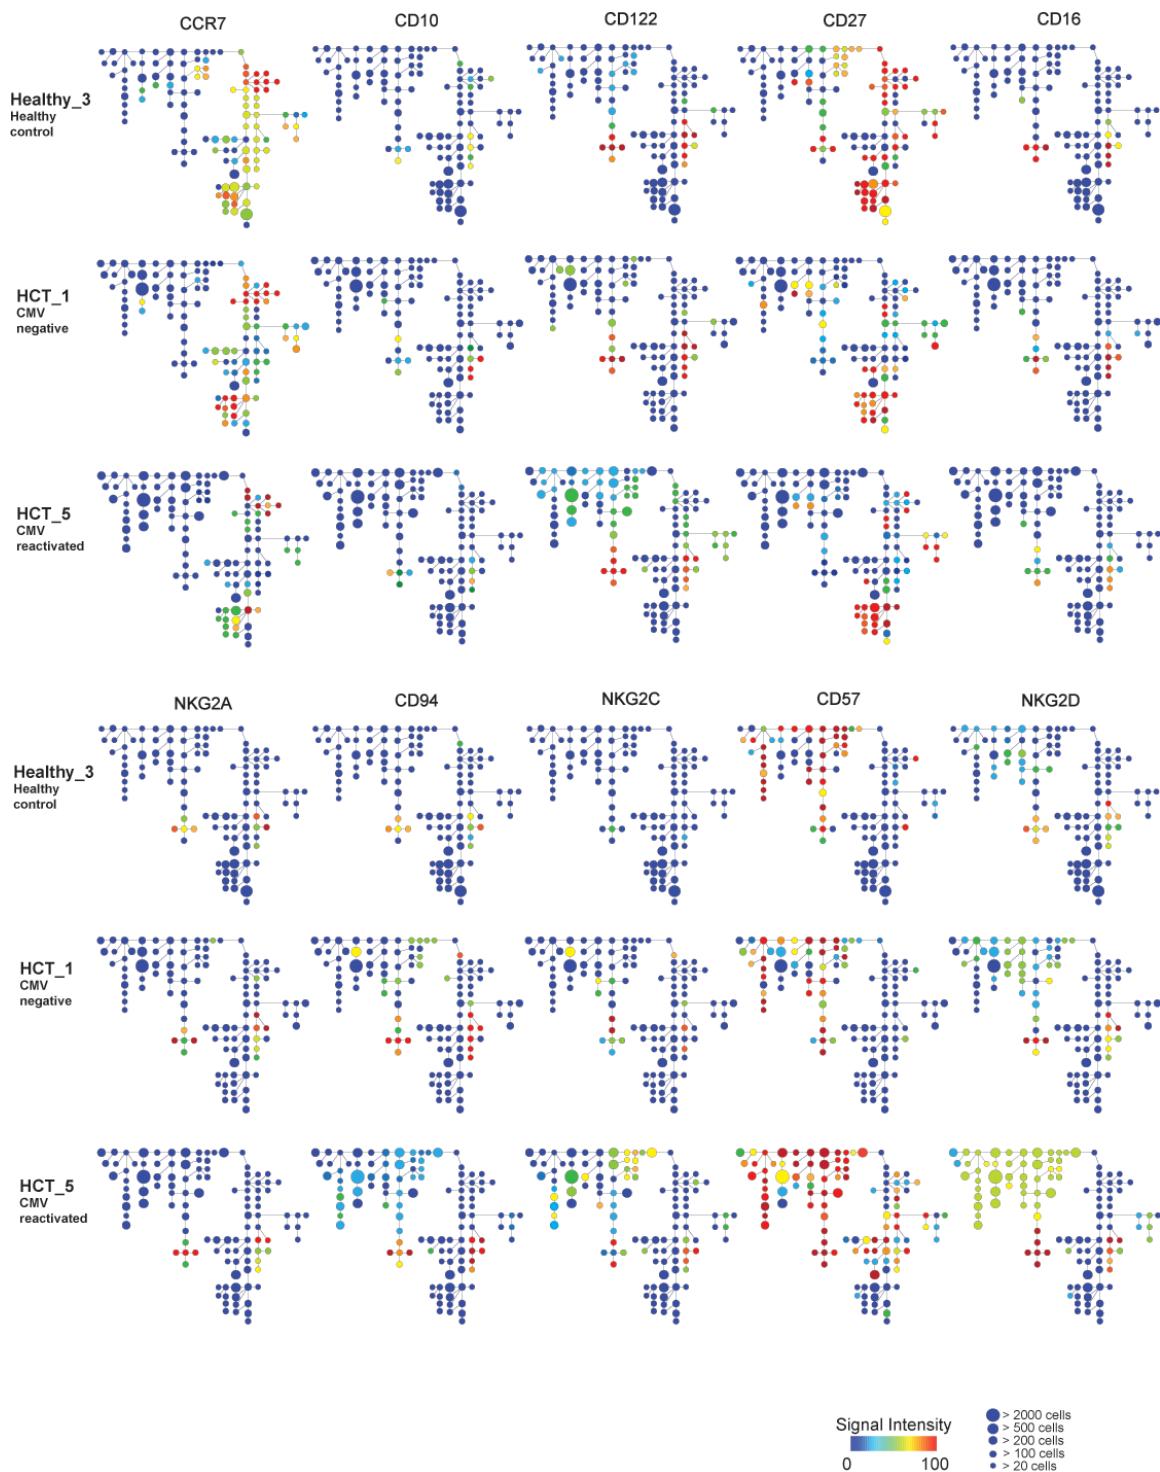

Fig. S2. SPADE analysis evaluating expression of NK cell receptors on T cells. SPADE clustering analysis for the same 3 representative samples used in Figs. 5 and 6 (Control, CMV-negative and CMV-reactivated) for evaluating distribution of NK cell receptors expressed across CD4, CD8 and CD4CD8 T cells. Node color represents signal intensity and size represents frequency.

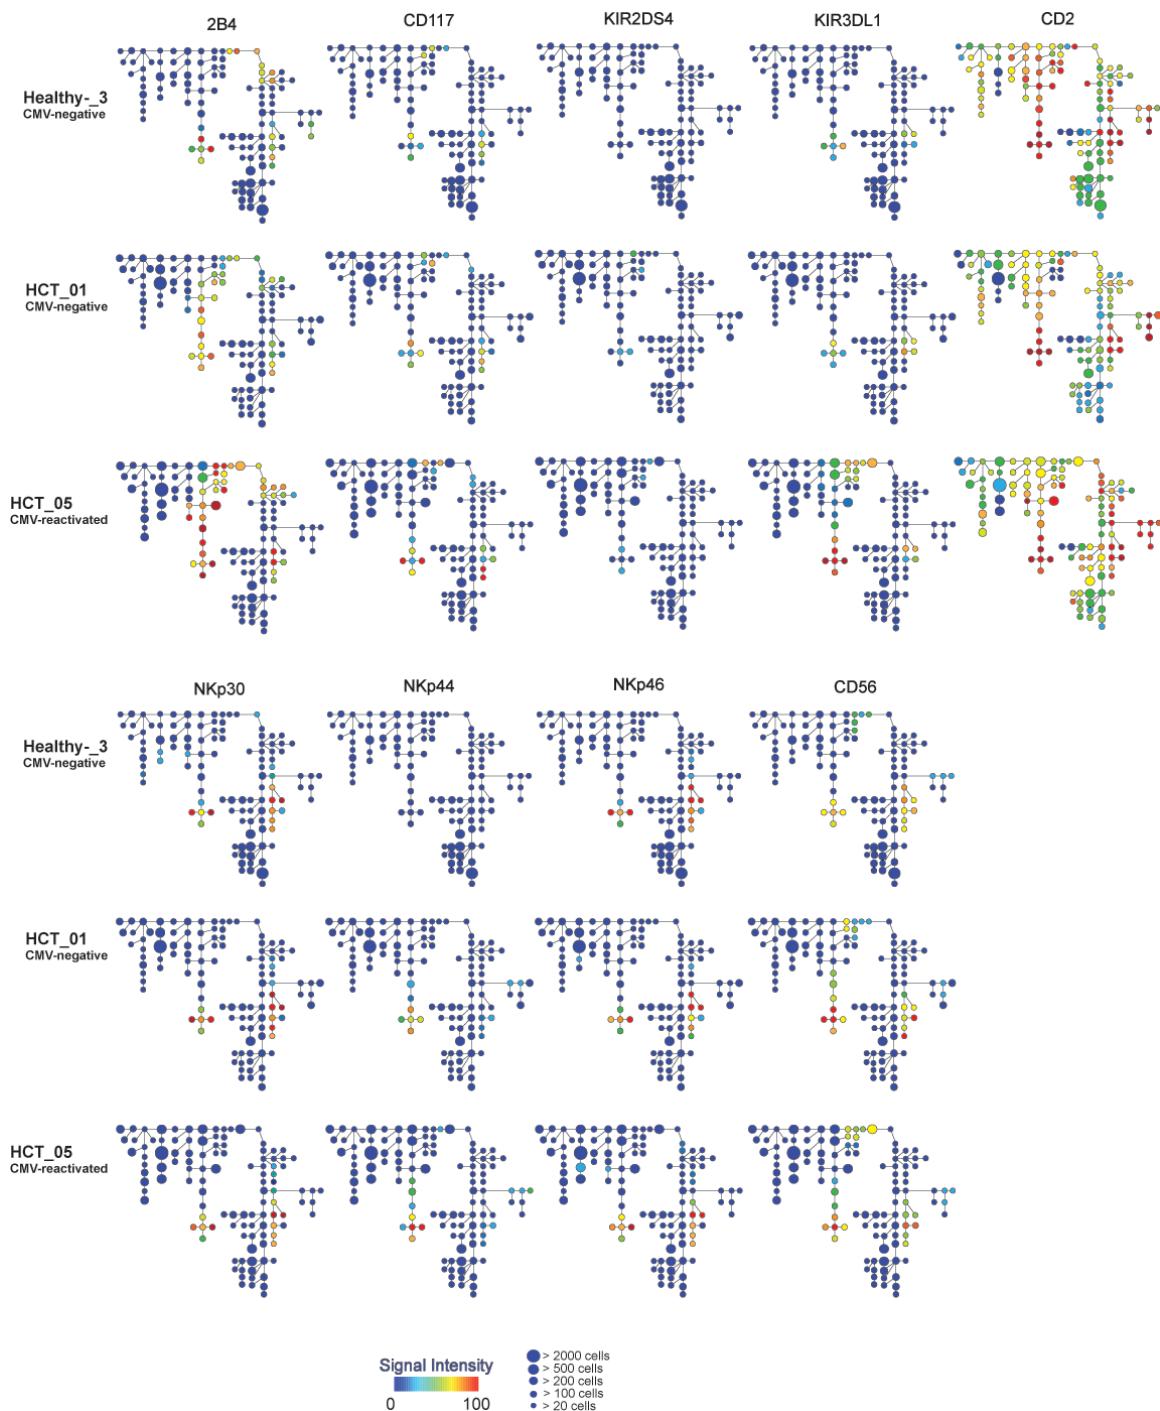

Fig. S3. Continuation of SPADE analysis evaluating expression of NK cell receptors on T cells. SPADE clustering analysis for the same 3 representative samples used in Figs. 5 and 6 (Control, CMV-negative and CMV-reactivated) for evaluating distribution of NK cell receptors expressed across CD4, CD8 and CD4CD8 T cells. Node color represents signal intensity and size represents frequency.

Table S1. Mass cytometry antibody panel

Isotope	Isotope Source	Antibody	Antibody Clone	Antibody Source
112 Cd/Q-dot	DVS Sciences	HLA-DR	Tu36	Invitrogen
