The total number of samples distributed by patients' race and gender is given in the first two columns. This is followed by number of samples with HPV-negative, HPV-active and HPV-inactive status and the overall fraction of samples HPV-positive by DNA. The last column reports the mean age of each group. The r by c chi-square test was conducted to test the degree of independence among the underlined values in the table ( $p=0.03934$ ).

The mean ages of HPV-active, HPV-inactive and HPV-negative patients by race and gender are also shown.

\* The age difference between EA HPV-active males and EA HPV-negative males was statistically significant with  $p = 0.0003$ .

<sup>#</sup> Among HPV-negative patients, AA men were considerably younger than EA men ( $p = 0.0023$ )
