

## Supplementary Data

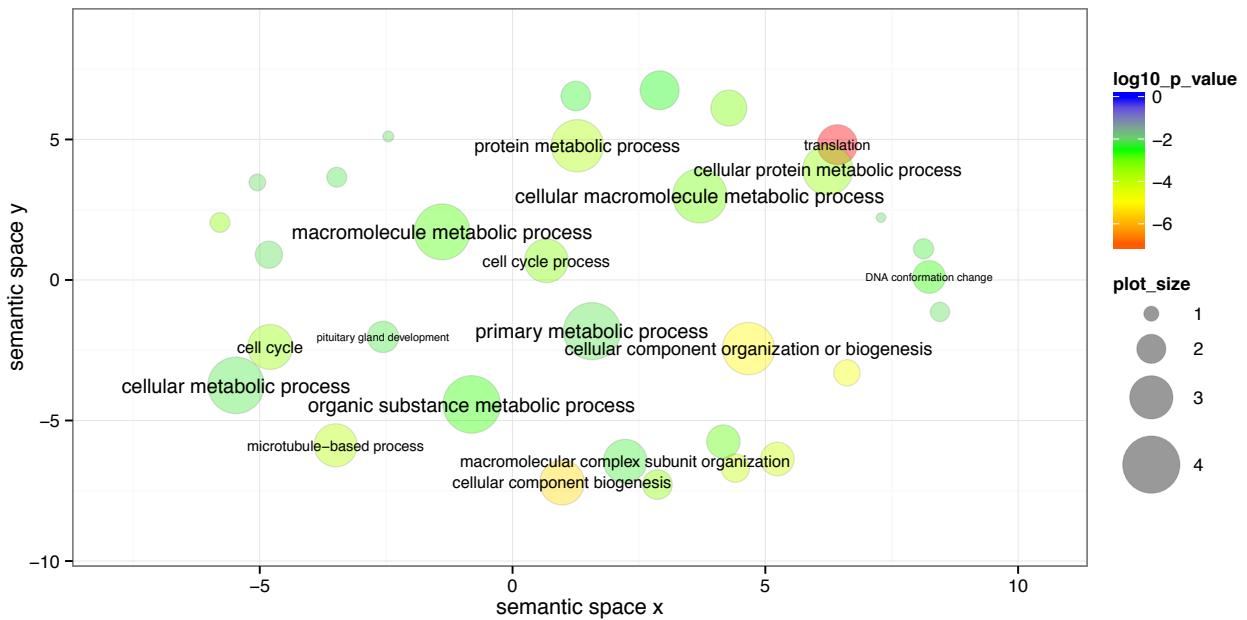

### Gene Ontology enrichment analysis

Gene Ontology (GO) functional annotation terms for all *Cardiocondyla obscurior* protein-coding genes have been published (Schrader et al. 2014) and can be downloaded from antgenomes.org. We used topGO (Alexa et al. 2006) to test for enrichment of GO terms (in the domain Biological Process) in the caste-biased gene sets using Fisher's exact test and the Parent-Child-algorithm (Grossmann et al. 2007) and considered GO terms to be significantly enriched at  $p < 0.01$ . We did not correct for multiple testing as the GO enrichment analysis was preliminarily performed for hypothesis generation. Visualization and summarization of the results was done with REVIGO (Supek et al. 2011). We retrieved five (WM), 39 (WO), 32 (QU) and 93 (EM) significantly enriched GO terms for the different gene sets (Supplementary Figures 1-4).

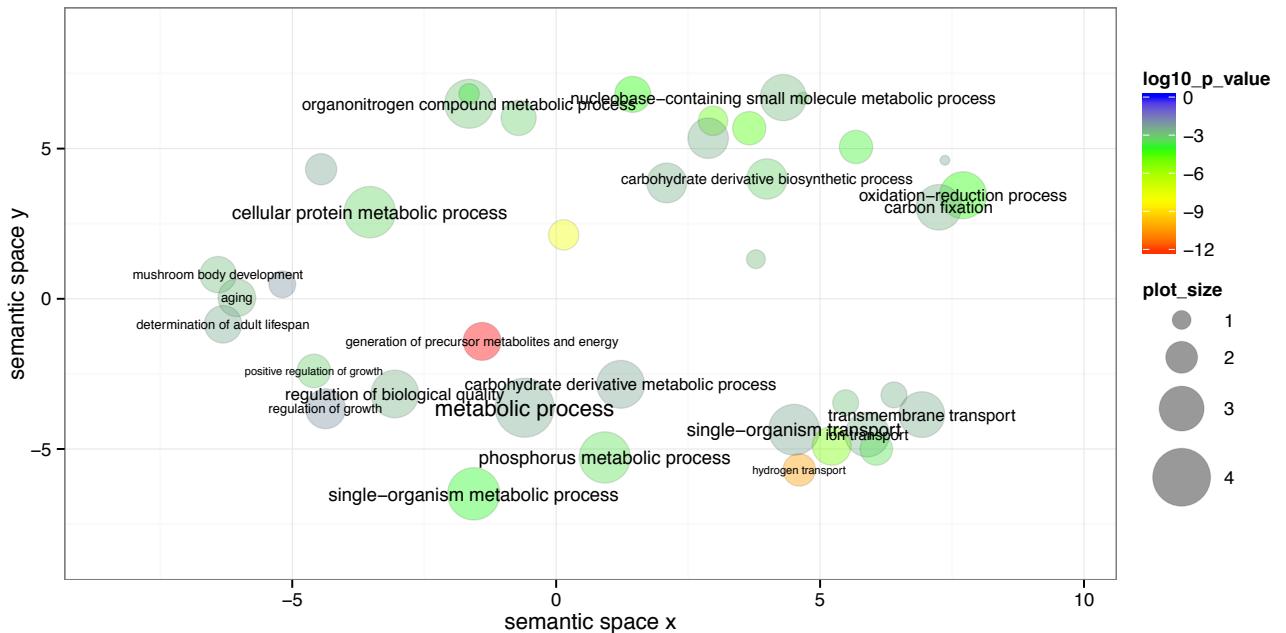

Supplementary Figure 1: GO enrichment analysis on the WM-biased gene set.

The scatter plot shows GO terms in a two-dimensional semantic space after reducing redundancy with REVIGO. Circle sizes are relative to the frequency of GO terms in the data.

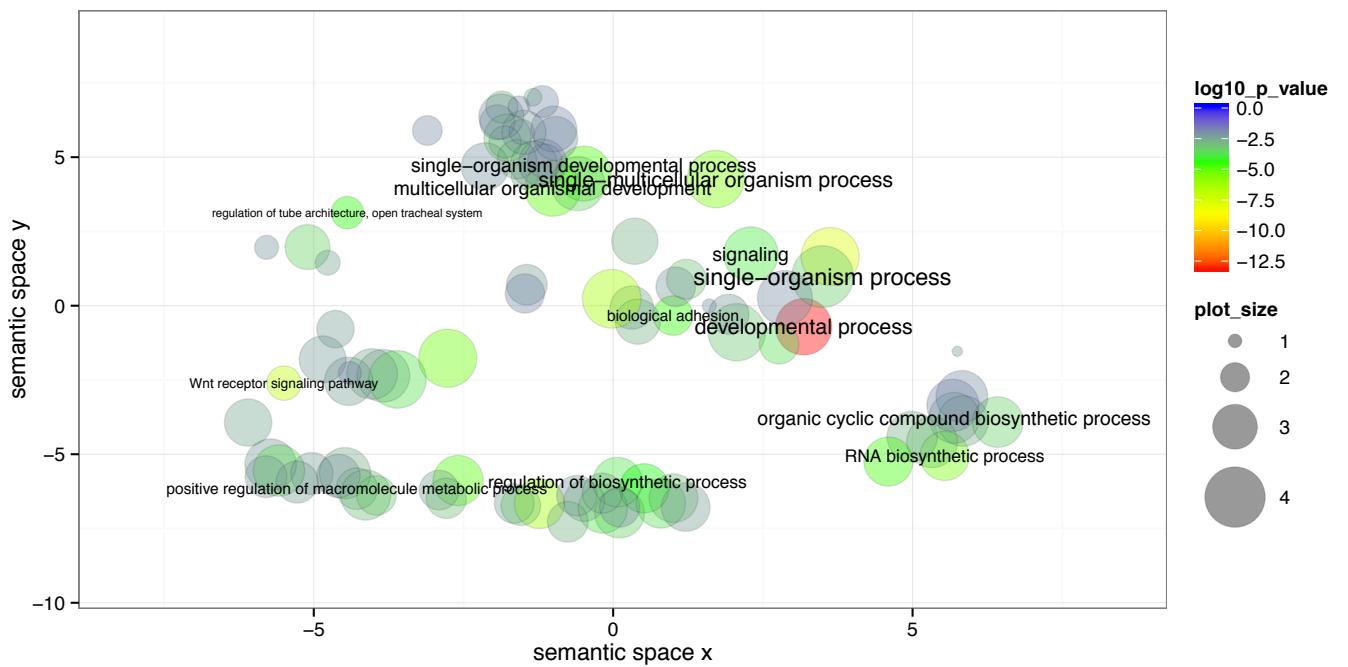

Supplementary Figure 2: GO enrichment analysis on the QU-biased gene set.

The scatter plot shows GO terms in a two-dimensional semantic space after reducing redundancy with REVIGO. Circle sizes are relative to the frequency of GO terms in the data.

Supplementary Figure 3: GO enrichment analysis on the WO-biased gene set.

The scatter plot shows GO terms in a two-dimensional semantic space after reducing redundancy with REVIGO. Circle sizes are relative to the frequency of GO terms in the data.

Supplementary Figure 4: GO enrichment analysis on the EM-biased gene set.

The scatter plot shows GO terms in a two-dimensional semantic space after reducing redundancy with REVIGO. Circle sizes are relative to the frequency of GO terms in the data.

Supplementary Table S1: List of genes that are either significantly up- or downregulated in QU compared to all three other phenotypes. The binary flag Orthology is set to 1, if orthology was confirmed in reciprocal blasts. The columns EM, QU, WM, and WO give the mean expression as assessed by limma. The last six columns give FDR values for pairwise comparisons, also produced with limma.

Supplementary Table S2: List of genes that are either significantly up- or downregulated in WO compared to all three other phenotypes. The binary flag Orthology is set to 1, if orthology was confirmed in reciprocal blasts. The columns EM, QU, WM, and WO give the mean expression as assessed by limma. The last six columns give FDR values for pairwise comparisons, also produced with limma.

Supplementary Table S3: List of genes that are either significantly up- or downregulated in EM compared to all three other phenotypes. The binary flag Orthology is set to 1, if orthology was confirmed in reciprocal blasts. The columns EM, QU, WM, and WO give the mean expression as assessed by limma. The last six columns give FDR values for pairwise comparisons, also produced with limma.

Supplementary Table S4: List of genes that are either significantly up- or downregulated in WM compared to all three other phenotypes. The binary flag Orthology is set to 1, if orthology was confirmed in reciprocal blasts. The columns EM, QU, WM, and WO give the mean expression as assessed by limma. The last six columns give FDR values for pairwise comparisons, also produced with limma.

Supplementary Table S4: Expression patterns of sphingolipid metabolic genes

The binary flag Orthology is set to 1, if orthology was confirmed in reciprocal blasts. The columns EM, QU, WM, and WO give the mean expression as assessed by limma. The last six columns give FDR values for pairwise comparisons, also produced with limma.
