

**Figure S2. Overlap between ICGG genes and the set of genes that were down-regulated upon DNMT1 depletion in the Sen et al. study (ref. 28).** The Venn diagram shows exclusive overlap of the Sen set of genes with ICGG genes, but not with PCCG genes. The 21 genes common to ICGG genes and the Sen set of genes are listed. Reference ICGG genes, which were used in subsequent analyses are highlighted in bold. The other reference ICGG gene, *CDCA7L*, is lacking in this list of common genes, because it was initially not represented on the microarray used by Sen et al.
