

Supporting Information for:

***Oxidative Addition of Carbon–Fluorine
and Carbon–Oxygen Bonds to Al(I)***

Mark R. Crimmin, Michael J. Butler and Andrew J. P. White

Department of Chemistry, Imperial College London, South Kensington, London SW7 2AZ, U.K. Tel:
+44(0)2075942846; E-mail: m.crimmin@imperial.ac.uk

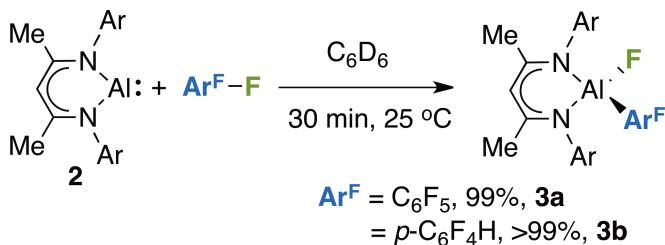

General Experimental

All manipulations were carried out under standard Schlenk-line or glovebox techniques under an inert atmosphere of nitrogen. A MBRAUN Labmaster glovebox was employed operating under an inert atmosphere of concentrations of H₂O and O₂ below 0.1 ppm. Glassware was dried for 12 hours at 120 °C prior to use. C₆D₆ and D₈-toluene were stored over molecular sieves for twelve hours before using. All other solvents were dried using a Grubbs type solvent purification system. ¹H, ¹³C, ²⁹Si NMR experiments were run within Youngs Tap NMR tubes on 400 MHz or 500 MHz BRUCKER machines. HSQC, and DEPT-135 experiments were run on a 400 MHz or 500 MHz NMR machine. The majority of ¹H spectra were recorded from + 30ppm to - 20ppm. Spectra were referenced to known solvent peaks. NMR analysis was conducted in Topspin or MestReNova with baseline corrections applied to spectra. All attempts to acquire satisfactory elemental analysis failed. Complex **2** was synthesised according to the literature procedure.¹

Synthetic Procedure for Oxidative Addition to Al(I)

*Procedure for the addition of fluoroarenes, fluoroalkanes (pentafluorobenzene, cyclohexylfluoride, n-hexylfluoride, hexafluorobenzene) to **2**:* In a glovebox **2** (20 mg, 0.045 mmol) was weighed into a 2mL scintillation vial and dissolved in 0.5 mL of benzene-d6, ferrocene (1-2 mg) was added to the solution and the mixture transferred to a J Youngs NMR tube. An initial time point was measured by ¹H NMR spectroscopy and the mixture returned to the glovebox, the fluorohydrocarbon or benzofuran (0.225 mmol, 5 equiv.) was added by micropipette For the fluorocarbons, an immediate colour change from red to yellow was observed. The reactions were monitored by ¹H and ¹⁹F NMR spectroscopy and showed formation of the corresponding products **3a-d** after 30 min at 25 °C. For benzofuran the mixture was heated to 80 °C for 24h and slow conversion to **4** was observed. At the end point of the reaction, the products were isolated by removal of the solvent and recrystallisation from n-hexane. NMR yields were measured by comparison to the ferrocene internal standard.
