Detailed text profiles for clusters {B, C, D, E, F, G, H, J, and K} in

Eisen M, Spellman P, Brown P, Botstein D: **Cluster analysis and display of genome-wide expression patterns.** *Proc Natl Acad Sci USA* 1998, 95:14863-14868.

For each cluster, the second column contains the top 10 scoring keywords extracted from MEDLINE abstracts that are associated in SGD to the genes of that cluster (listed in column 1). The last column contains the top 10 keywords (provided that many are available) derived from the GO annotations for the gene cluster under consideration.

In clusters B and C we observe the complementary nature of MEDLINE information. Terms extracted from MEDLINE such as `spindle pole body', 'cytokinesis' and 'anaphase promotor complex' are more reminiscent of the overall function of cluster B than the most of the less-specific GO-extracted terms such as 'cytoskeleton', 'protein binding' and 'bud neck'. One exception is the GO-term 'microtubuli nucleation', which contributes to the biogenesis of the microtubule cytoskeleton. For cluster C, the difference is even more pronounced as the GO term `degrad' is the only one referring (vaguely) to the asserted proteasome function of this cluster. For the remaining clusters, terms extracted from MEDLINE and GO refer to the same biological function. Hence, term-based analysis of literature can be valuable to complement annotations in public databases.

| SGD yeast gene names | MEDLINE-based profiles | GO-annotation -based profiles |
|--|------------------------|-------------------------------|
| CLUSTER B (spindle pole assembly and function) | | |
| stu2 | spindl_pole_bodi | cytoskeleton |
