

Figure S4

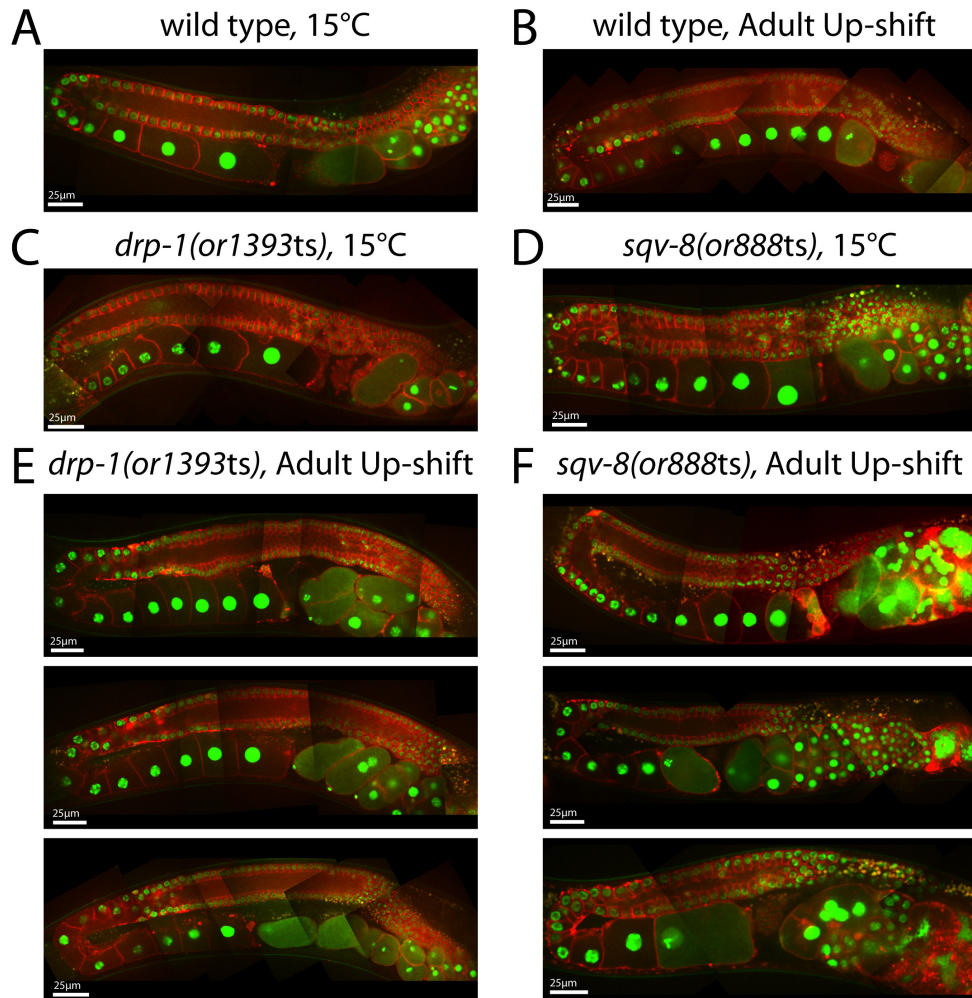

Figure S4 Lack of germline defects in *drp-1(or1393ts)* and *sqv-8(or888ts)* mutants after young adults were up-shifted to the restrictive temperature (26°C). Composite images of the germline were prepared as previously described for wild type (A, B), *drp-1(or1393ts)* (C, E), and *sqv-8(or888ts)* (D, F) worms. These animals were either grown entirely at 15°C, or shifted to 26°C as young adults for 18 hours.
