

## Supporting Information

Table S1. Muropeptide composition<sup>a</sup> of PG from *V. cholerae* LMW PBP mutants

|                      | wt    | $\Delta dacA-1$ | $\Delta dacA-2$ | $\Delta dacB$ | $\Delta pbpG$ | $\Delta A2\Delta G$ | $\Delta B\Delta G$ | $\Delta 3$ |
|----------------------|-------|-----------------|-----------------|---------------|---------------|---------------------|--------------------|------------|
| Monomers             | 40.62 | 55.19           | 43.40           | 44.97         | 43.27         | 40.33               | 39.12              | 43.97      |
| Dimers               | 26.10 | 21.12           | 25.36           | 24.24         | 24.96         | 26.59               | 26.04              | 24.43      |
| Trimers              | 2.39  | 0.86            | 1.96            | 2.18          | 2.27          | 2.16                | 2.93               | 2.39       |
| Tripeptides          | 5.78  | 2.71            | 3.80            | 6.06          | 5.12          | 4.66                | 3.85               | 4.76       |
| Tetrapeptides        | 60.31 | 56.00           | 62.26           | 60.95         | 62.28         | 61.18               | 59.66              | 59.39      |
| Pentapeptides        | 2.52  | 17.83           | 3.50            | 3.60          | 2.58          | 2.83                | 3.54               | 5.37       |
| Anhydro peptides     | 10.38 | 6.35            | 10.20           | 12.28         | 10.13         | 9.83                | 14.14              | 11.59      |
| Average chain length | 9.64  | 15.74           | 9.80            | 8.14          | 9.87          | 10.17               | 7.07               | 8.63       |
| Crosslink            | 27.30 | 21.55           | 26.34           | 25.33         | 26.10         | 27.68               | 27.51              | 25.63      |
| LD-crosslink         | 1.57  | 0.71            | 1.68            | 1.46          | 1.96          | 1.60                | 1.23               | 1.21       |
| DD-crosslink         | 25.73 | 20.84           | 24.66           | 23.87         | 24.14         | 26.07               | 26.28              | 24.41      |

<sup>a</sup> Relative amounts of muropeptides were calculated as described by Glauner (Glauner, 1988). The values are the means of two independent experiments.

Table S2. Strains used in this study

| Strain name                       | Strain # | genotype/description  | reference/source          |
|-----------------------------------|----------|---|---------------------------|
| C6706                             |          | <i>V. cholerae</i> wild-type strain C6706 El Tor                          | (Thelin and Taylor, 1996) |
| C6706 <i>lacZ</i> -               |          | <i>lacZ</i> -negative derivative of C6706                                 | (Cameron et al., 2008)    |
| <i>E. coli</i> DH5α λpir          |          | cloning strain  | (Kolter et al., 1978)     |
| <i>E. coli</i> SM10 λpir          |          | conjugation strain  | (Simon et al., 1983)      |
| <i>E. coli</i> MFD pir            |          | DAP auxotroph conjugation strain  | (Ferrieres et al., 2010)  |
| <i>ΔdacA-1</i>                    | AM647    | C6706 $\Delta$ VCA0947  | This work                 |

Table S3. Plasmids used in this study

| Plasmid   | description   | reference/source        |
|-----------|---|-------------------------|
| pDS132    | <i>sacB</i> -containing suicide vector for double homologous recombination, <i>camR</i>   | (Philippe et al., 2004) |
| pBAD18kan | replicating plasmid used for expressing constructs under control of the arabinose-inducible P <sub>BAD</sub> promoter, <i>kanR</i>  | (Guzman et al., 1995)   |
| pAM224    | integrating plasmid, R6K, <i>kanR</i>   | This work               |
| pAM233    | pDS132::VC0947 flanking regions   | This work               |
| pAM270    | pDS132::VCA0270 flanking regions  | This work               |
| pAM290    | pDS132::VC0632 flanking regions   | This work               |
| pAM291    | pDS132::VCA0870 flanking regions  | This work               |
| pAM298    | pAM299-derived plasmid to generate P <sub><i>dacA-2</i></sub> ::P <sub>BAD</sub> : <i>dacA-2</i>                                    | This work               |
| pAM299    | pAM224-derived integrating plasmid containing pBAD, <i>kanR</i>   | This work               |
| pAM312    | pAM299-derived plasmid to generate P <sub><i>dacA-1</i></sub> ::P <sub>BAD</sub> : <i>dacA-1</i>                                    | This work               |
| pAM325    | pAM224-derived integrating plasmid containing <i>lacZ<sub>EC</sub></i> , <i>kanR</i>  | This work               |
| pAM326    | pAM325-derived plasmid to generate P <sub><i>dacA-1</i></sub> ::P <sub><i>dacA-1</i></sub> : <i>lacZ<sub>EC</sub></i> (merodiploid) | This work               |
| pAM327    | pAM325-derived plasmid to generate P <sub><i>dacA-2</i></sub> ::P <sub><i>dacA-2</i></sub> : <i>lacZ<sub>EC</sub></i> (merodiploid) | This work               |
| pAM332    | pBAD18kan::VC0947   | This work               |
| pAM333    | pBAD18kan::VCA0270  | This work               |

## Supplementary Fig legends

**Fig. S1.** Alignment of *V. cholerae* *dacA-1* and *dacA-2* and *E. coli* *dacA* protein sequences. Active site residues are shaded in light red.

**Fig. S2.** A. Growth of  $\Delta$ *dacA-1* and wild type *V. cholerae* in M9 medium. B. Comparison of CFU/ml (based on plating on LBSF agar) and OD600 during growth of  $\Delta$ *dacA-1* and wild type cells. Note the different scale bars. C. Phase contrast images of  $\Delta$ *dacA-1* cells from different culture densities. D. Growth of  $\Delta$ *dacA-1* complemented by *DacA-2* overproduction. Shown is the growth of wild-type cells in LB medium, and  $\Delta$ *dacA-1* cells expressing ectopic *dacA-2* under control of the  $P_{BAD}$  promoter grown in LB and LB supplemented with 0.4% arabinose.

**Fig. S3.** Comparisons of PG composition for *V. cholerae* LMW PBP mutants. The relative molar abundance of total M5 monomers and D45 dimers (A), total tripeptides (B), and total anhydro muropeptides (C) are shown. Stars indicate statistically significant differences based on unpaired t-test (\* $p \leq 0.1$ , \*\* $p \leq 0.01$ , \*\*\* $p \leq 0.001$ ).

**Fig. S4.** TnSeq analysis shows that *dacA-1* is not essential in salt free LB. Red and green vertical bars show the relative abundance in TnSeq data of reads corresponding to forward and reverse strand insertions within the indicated genes. Reads are shown for *V. cholerae* libraries culture in LBSF or in LB. Black lines (TA sites) show all possible transposon insertion sites.

**Fig. S5. A.** Growth curves of wild type and  $\Delta dacA-1$  strains grown in salt-free LB (LBSF), then transferred LBSF or LB containing 500 mM NaCl (LBHS). **B.** Phase contrast images of  $\Delta dacA-2 dacA-1$  cond grown with and without inducer in salt-free LB medium.
