

Additional files 7. The interaction analysis of wheat TaCBL and TaCIPK proteins were performed by Y2H method. TaCIPKs and TaCBLs were respectively cloned to PGAD and PGBK vectors, and then co-transformed into Y187 strains. The transformants containing the target plasmid combinations were grown on either the double dropout medium (DDO: SD/-Trp/-Leu) or triple dropout medium (TDO: SD/-Trp/-Leu/-His/+10mM 3AT)
