

Supporting Information

Figure A. Variations in mean annual temperature, mean annual precipitation, and aridity index with elevation in Yunnan Province, China.

Figure B. Sampling density for different elevational intervals.

Figure C. Land areas for different elevational intervals.

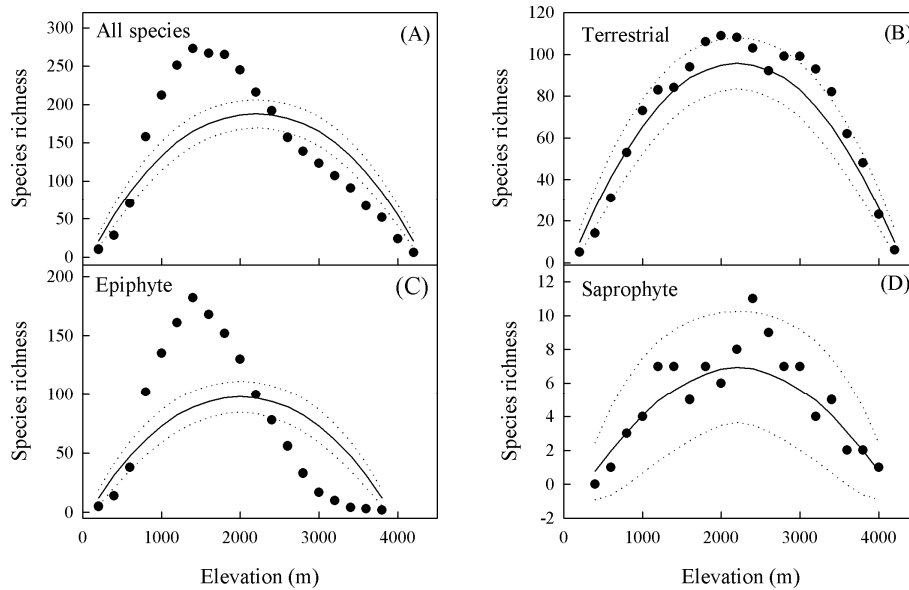

Figure D. Elevation-related patterns of richness for all orchid species (A), and terrestrial (B), epiphyte (C), and saprophyte (D) forms in Yunnan, China. Solid dots and solid lines represent observed and predicted species richness, respectively. Dashed lines show 95% confidence intervals predicted by MDE randomization model.

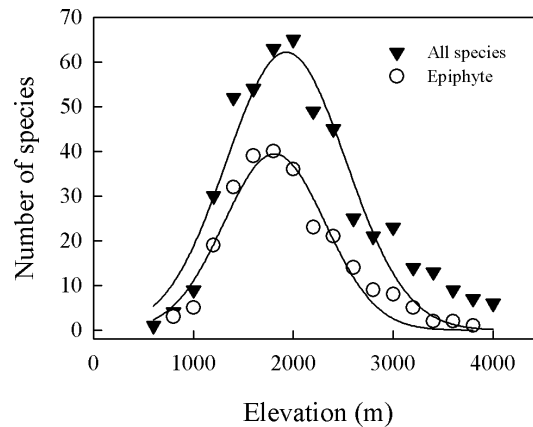

Figure E. Elevational gradients for orchid species richness in the Gaoligong Mountains, Yunnan.

Table A. Important genera within the Orchidaceae family in Yunnan Province, China.

Genus	Number of species	Genus	Number of species
<i>Dendrobium</i>	56	<i>Oberonia</i>	16
<i>Bulbophyllum</i>	42	<i>Peristylus</i>	16
<i>Habenaria</i>	31	<i>Goodyera</i>	14
<i>Liparis</i>	30	<i>Anoectochilus</i>	12
<i>Calanthe</i>	27	<i>Cleisostoma</i>	10
<i>Eria</i>	25	<i>Malaxis</i>	10
<i>Cymbidium</i>	23	<i>Orchis</i>	10
<i>Platanthera</i>	21	<i>Paphiopedilum</i>	10
<i>Coelogyne</i>	18	<i>Pholidota</i>	10
<i>Cypripedium</i>	16	<i>Pleione</i>	10
<i>Herminium</i>	16		

Table B. Estimated parameters of linear regression models used to explore the relationships among species richness and density, elevation, and other environmental variables. Each midpoint indicates where the value of response was maximum. Aridity index was calculated as potential evapotranspiration rate divided by mean annual precipitation.

Independent variable	Response variable	Confidence interval (95%) for independent variable (midpoint value)	Related figure
	Specimen richness	1535–1865 (1700)	3A
	Genus richness	1395–1723 (1559)	3A
