

Supplementary Information

Studying Ancient Anthropogenic Impacts on Current Floral Biodiversity in the Southern Levant as reflected by the Philistine Migration

Suembikya Frumin¹, Aren M. Maeir¹, Liora Kolska Horwitz² & Ehud Weiss¹

Table S1: Structure of archaeobotanical data for Bronze and Iron Age Sites.

| | Bronze Age | | | Iron Age | | | |
|-------------|---|---------|------------------|----------|--|---------|------------------|
| Site Name | Contexts | NN Taxa | NN Plant Remains | Culture | Context | NN Taxa | NN Plant Remains |
| Afula | Pit, 3 other loci | 9 | no data | nonPhil | Storage jars | 6 | 41 |
| Aphek | Halls in building, governor palace, street, winepress | 81 | 29180 | Phil | Building, dump pits, threshing floor | 110 | 3620 |
| | | | | nonPhil | Settlement, 5 pits, silos, intact jars with grains | 50 | 21398 |
| Arad | Various strata within building - kitchen-storeroom, bins, pithoi, jars | 22 | 60 kg | nonPhil | Various loci from occupation layers | 5 | >61 |
| Ashdod | 2 loci from occupation levels and installation, refuse dump by installation | 9 | 713 | 0 | | 0 | |
| Ashkelon | | 0 | | Phil | Administrative center, counting house, shops, streets, silo, warehouse magazines | 178 | 19,543 |
| Be'er Sheba | | 0 | | nonPhil | Various loci from occupation Layers | 5 | ca 30 |
| Beth Shean | Occupation strata, 13 L | 53 | 36768 | nonPhil | Building, destruction debris on floor | 33 | 150559 |

| | | | | | | | |
|---------------|--|----|---------------------|---------|---|----|---------|
| City of David | | 0 | | nonPhil | Occupation Layers | 12 | no data |
| Dalit | Domestic area | 1 | no data | 0 | | 0 | |
| Ekron | Destruction debris, vessel, storage jar | 51 | 924 | Phil | Room floor, pit, fill, fireplaces | 91 | 6940 |
| Rosh Zayit | | 0 | | nonPhil | Jars in storeroom | 40 | 184440 |
| Ifshar | Grain` storeroom, food prep. area, courtyard | 11 | 32106 | nonPhil | Storage pit near house, 2 other storage pits | 15 | 847 |
| Jericho | silo, 7 tombs, room, pot, 3 shafts, etc. | 56 | ND | 0 | | 0 | |
| Kedesh | | 0 | | nonPhil | Pit sealed under floor | 1 | 2 |
| Keisan | | 0 | | nonPhil | Silo | 9 | 5235 |
| Lachish | ND | 12 | 167 cm ³ | nonPhil | ND | 10 | 300 cm3 |
| Manahat | Sealed contexts on floor, fireplaces and around them | 17 | 411 | 0 | | 0 | |
| Megiddo | Accumulation on floors, pits, bone accumulation in the temple compound, burials, refuse deposit, plaster floor | 28 | 816 | nonPhil | Floors, pits, various installations, buildings. floor, destruction layer, large storage jar | 23 | 348 |
| Qasile | | 0 | | Phil | Destruction debris under temple, and adjacent 2 buildings | 16 | 13303 |
| Ramat Matred | | 0 | | nonPhil | Occupation Layers | 1 | 1 |
| Safi/Gath | Accumulation floor in building, room | 15 | 249 | Phil | Destruction debris, room floor | 34 | 1003 |
| Shiloh | ND, 8 loci | 21 | 357 | nonPhil | Silo, 2 loci out of 74 loci | 33 | 22952 |
| Shiqmim | 22 samples - lower village building phase | 5 | 22 | 0 | | 0 | |
| Ta'anach | ND, 7 loci | 19 | ND | nonPhil | ND, 6 loci | 9 | ND |

| | | | | | | | |
|--------|---|----|--------|---------|------------------|---|-----|
| Batash | Building, sealed jar, etc at least 3 loci | 55 | 220761 | nonPhil | ND, 10 loci | 1 | ND |
| | | | | Phil | ND, 9 loci | 1 | ND |
| Rehov | | 0 | | nonPhil | 9 different loci | 1 | 200 |

Each site is characterized by time period (Bronze Age and Iron Age), cultural affinity of Iron Age Strata (Philistine or non-Philistine), context contained remains of seeds and fruits, number of taxa recognized, and number of plant remains analyzed. Phil – Philistine Strata; nonPhil – other than Philistine Strata within the Iron Age. ND – no data in publication.

Table S2: The archaeobotanical record of Southern Levant in Bronze and Iron Ages. Data based on studies of remnants of flowers, fruits, and seeds. Species ecology is denoted as cult = cultivated species; w/w = wild and/ or weed species. Iron Age Aphek contains both Philistine (Phil) and non-Philistine (nonPhil) strata.

| List of Taxa | Ecology | Bronze Age | Iron Age Phil | Iron Age nonPhil |
|--------------------------------------|---------|--|--|---|

SI 3 Evaluation of Possible Link Between Species Ubiquity and Sample Size

The data base for archaeobotanical samples of seeds and fruits from the Bronze Age, Philistine Iron Age Strata, and non-Philistine Iron Age strata examined in this study comprises identifications of 447 plant taxa determined to the species level and below.

To resolve the problem of possible link between sample size and species richness, we ran a Rarefaction test on the plant data base using the PAST statistical package (Hammer et al. 2001). As noted by Magurran (1991), Rarefaction addresses the issue of unequal sample sizes by calculating the numbers of species expected in each sample as if all samples were the same size. This test assumes that the sampled objects are randomly distributed in an environment, they are taxonomically similar and that sampling was carried out in the same manner.

Figure SI 3. Graph showing rarefaction curves for plant remain counts (X axis) by FL against numbers of plant taxa (Y axis).

The red line (Fig. SI 3) represents the calculated rarefaction curve for each period, which is a plot of the number of species as a function of the number of specimens (seeds and fruit), while the blue lines represent the 95% confidence limits calculated for each.

The rarefaction curves initially follow a steep slope as the most common species are found. Thereafter they flatten out to form a plateau as the most common species have been sampled and only the rarest species remain to be sampled. As illustrated in the graph, the curves for the Bronze Age and Iron Age non-Philistine FL follow such a pattern. They both flatten out to the right indicating that a reasonable number of individual samples have been examined and that more intensive sampling will yield only few additional species. Moreover, the difference in taxon number between these two samples, indicates that unrelated to sample size, fewer taxa are found in the non-Philistine Iron Age sample.

In contrast, the Iron Age Philistine FL on the left follows a different trajectory, with a steep slope on the left that does not flatten out to the right. This indicates that a large portion of the species diversity still remains to be discovered. While taxon diversity is beginning to flatten out at ca. 60,000 specimens for the two other periods, the curve is still rising for the Iron Age Philistine sample so that it lies far above that for both the Bronze Age and non-Philistine Iron Age FLs.

Clearly, the Iron Age Philistine assemblage contains a significantly higher number of species that will increase further, given a larger sample size. One can extrapolate the trajectory of this curve by extending the line, such that when a sample size of 180,000 specimens is attained, taxon number would reach ca. 300. These results demonstrate that the higher plant diversity in the Iron Age Philistine assemblages is not an artifact of sample size but a true reflection of the composition of the floral assemblage.
