

## $\alpha$ -TP53 adjusted for time in freezer

**Supplemental Figure 3** – Anti-TP53 expression and time of storage. When adjusted for the time each serum was stored in the freezer, anti-TP53 values of the first draw (diagnostic for patients) and the second draw (post-therapy for patients) from each individual correlated ( $p < 0.005$  for cases and  $p = 0.029$  for controls).
