compound name: note, some compounds were tested and therefore listed several times based on their presence in different bioactive screening libraries.

μg/ml and μM: final concentration of compound in screening wells.

fold-reduction: the reduction in luminescence relative to untreated control wells determined on day 2 of incubation. Fold reduction to a level equal to or below positive control wells (10μg/ml levofloxacin) was considered complete elimination.

z-lux: the z-score for reduction in luminescence of test wells compared to untreated controls determined on day two of infection.

z-cytotox: the z -score for cytotoxicity of tests wells compared to 10μg/ml levofloxacin treated control wells on day 1 of infection, assessed based on increase in SYTOX Green fluorescence.

z-antitox: the z-score for cytopreservation of test wells compared to the negative controls wells on day 2, based on reduction in SYTOX Green fluorescence.

hit strength: based on scale-fold reduction described in Table 1 legend. Those without designation were inactive (i.e., z-score for luminescence reduction < 3). Those labeled toxic had a z-cytotox >=3.
