Sampling of peripheral blood

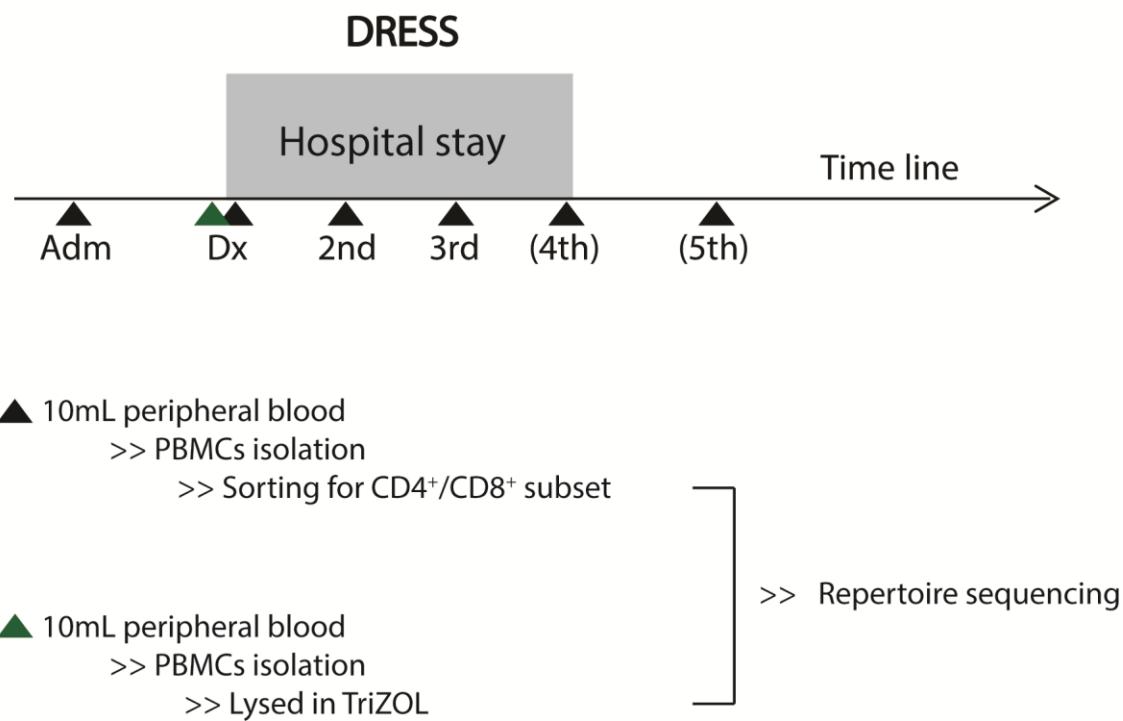

Figure-S1. Patients and sample procurement

Schematic view of collection of blood samples from DRESS patients. Grey areas show the duration of hospital stay. Adm, administration of the culprit drug; Dx, diagnosis; brackets, sampling from only certain patients. Black triangle, sampling for sorting of CD4⁺/CD8⁺ T-cell subset. Green triangle, sampling for PBMC sequencing.

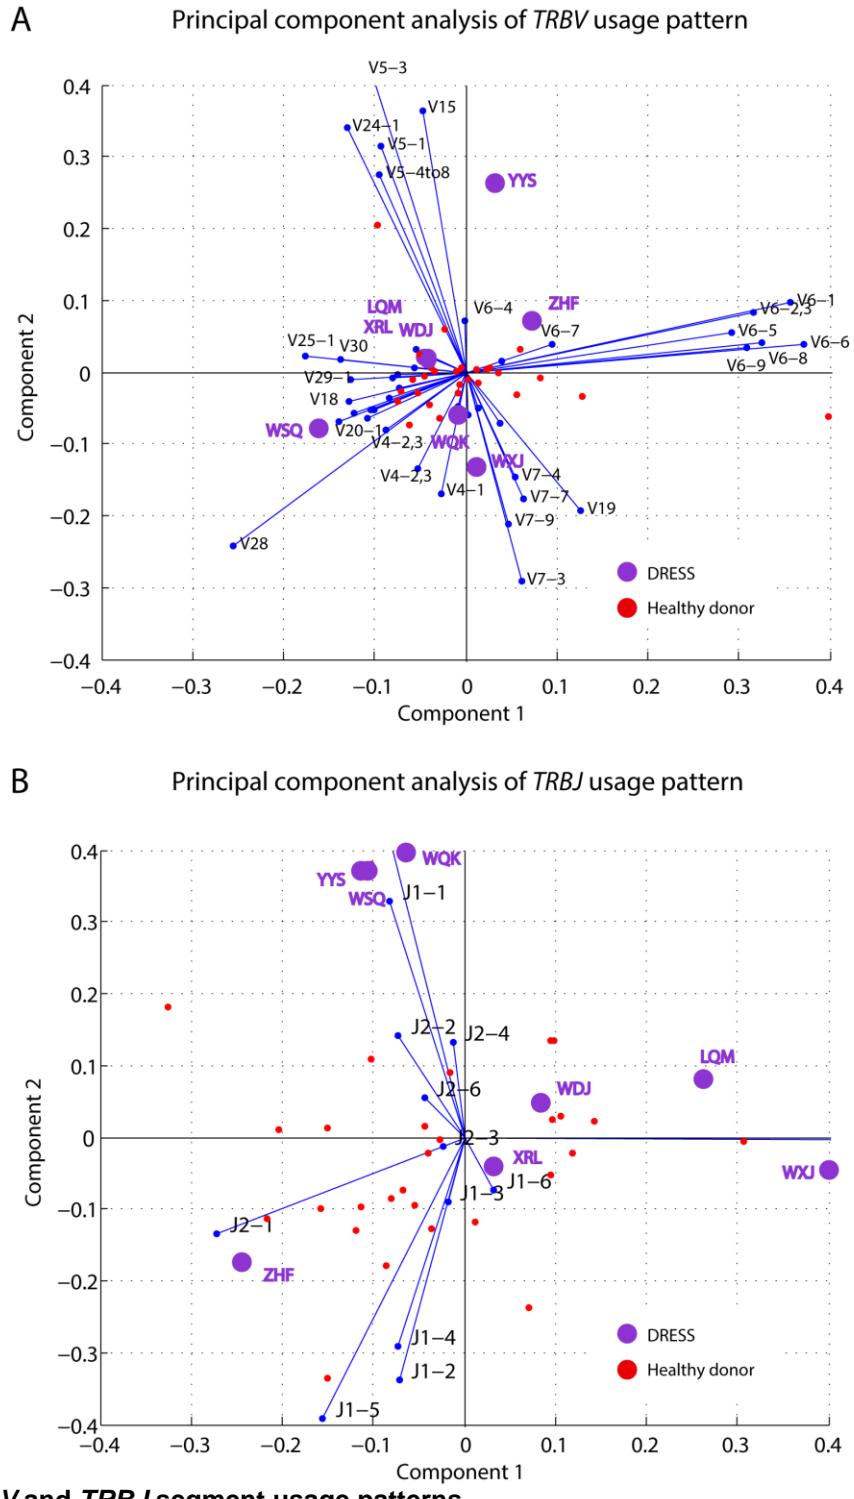

Figure-S2. *TRBV* and *TRBJ* segment usage patterns

Principal component analysis showed the overall usage patterns of (A) *TRBV* and (B) *TRBJ* segments for patients with DRESS and healthy donors. The scatterplot helps to visualize both the principal component coefficients for each gene segment and the principal component scores for each patient. The purple and red dots represent the PBMC repertoires from patients with DRESS and from healthy donors, respectively. Parts of the label for the V-beta segment were deleted to improve visual clarity.

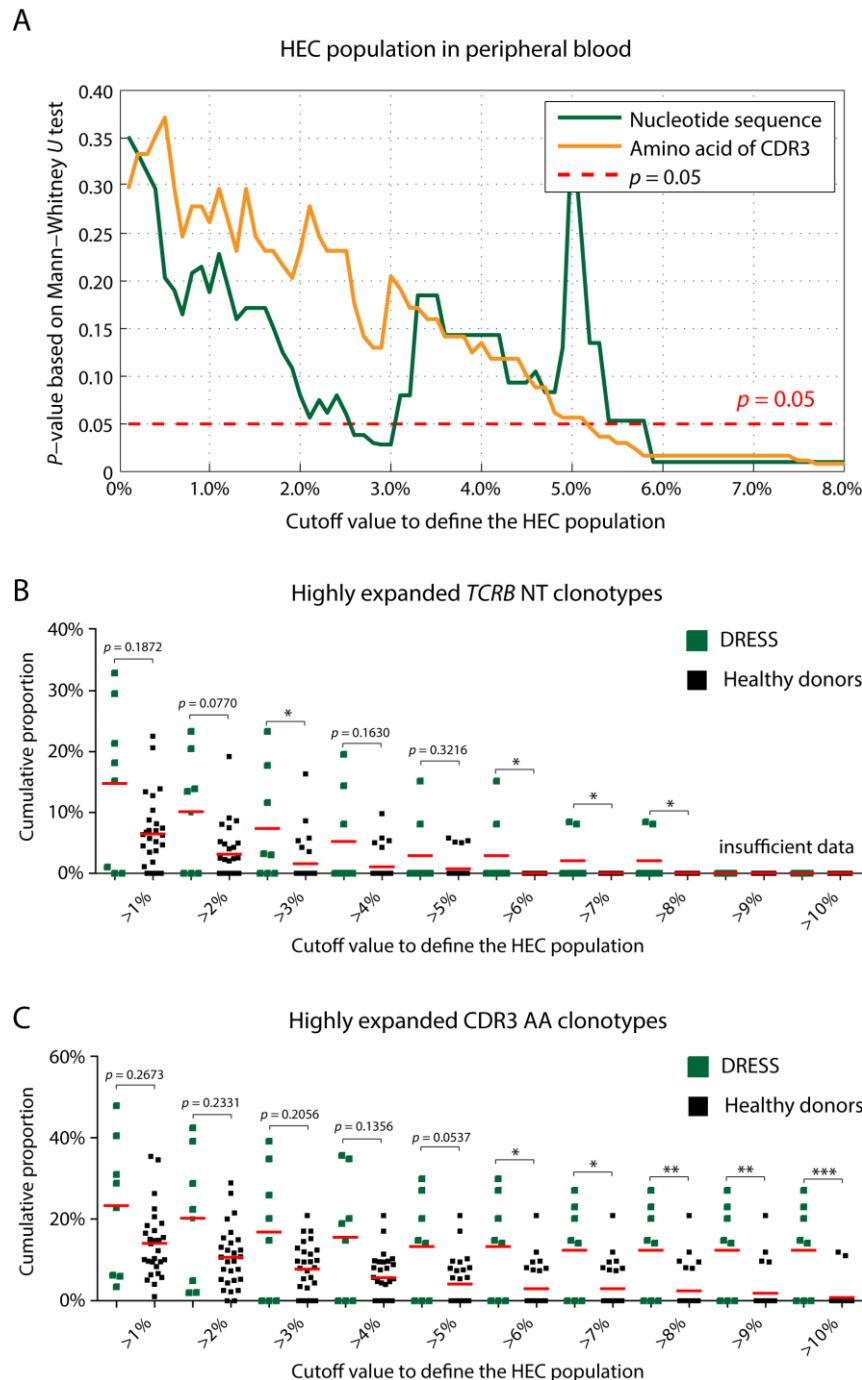

Figure-S3. Accumulation of highly expanded clonotypes in DRESS patients

(A) Mann-Whitney *U*-tests were used to compare the proportions of highly expanded clones (HECs) in patients and healthy donors. Significance of increased HECs in DRESS patients is represented as the *p*-value of the hypothesis test against the cutoff percentage that defined this HEC population. Calculation was performed for both the *TCRB* NT clones (defined as the T-cell population in which the nucleotide sequences in the entire *TCRB* transcript were identical) and for the CDR3 AA clones (defined as the T-cell population in which the amino acid sequence in the CDR3 region were identical). **(B, C)** Comparison of the proportion of expanded clones for both *TCRB* NT and CDR3 AA clones. Cutoff values for defining the HEC population are indicated on the horizontal axis (at intervals at 1%). Red bars, median values. Statistics based on Mann-Whitney *U*-tests.

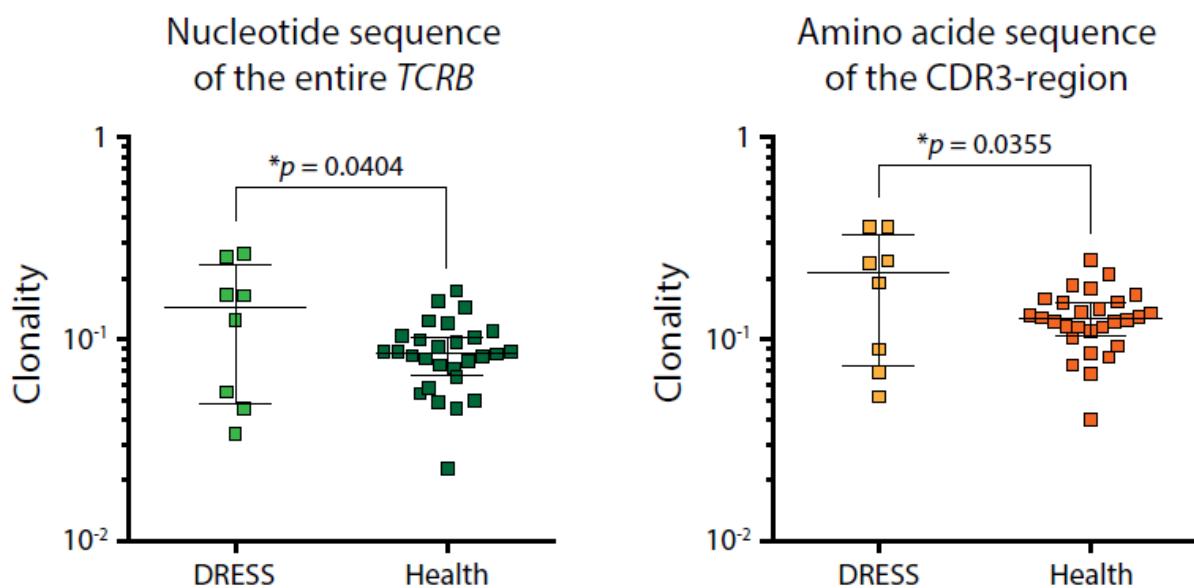

Figure-S4. Oligo-clonality of repertoire from peripheral blood

Dot plots showed the clonality index for DRESS cohort and condition-matched healthy donors. Higher index value, significant oligo-clonality; lower index value, prefer to poly-clonality. Left panel, for nucleotide sequence in the entire TCRB locus; right panel, for the amino acid sequence in CDR3 region.

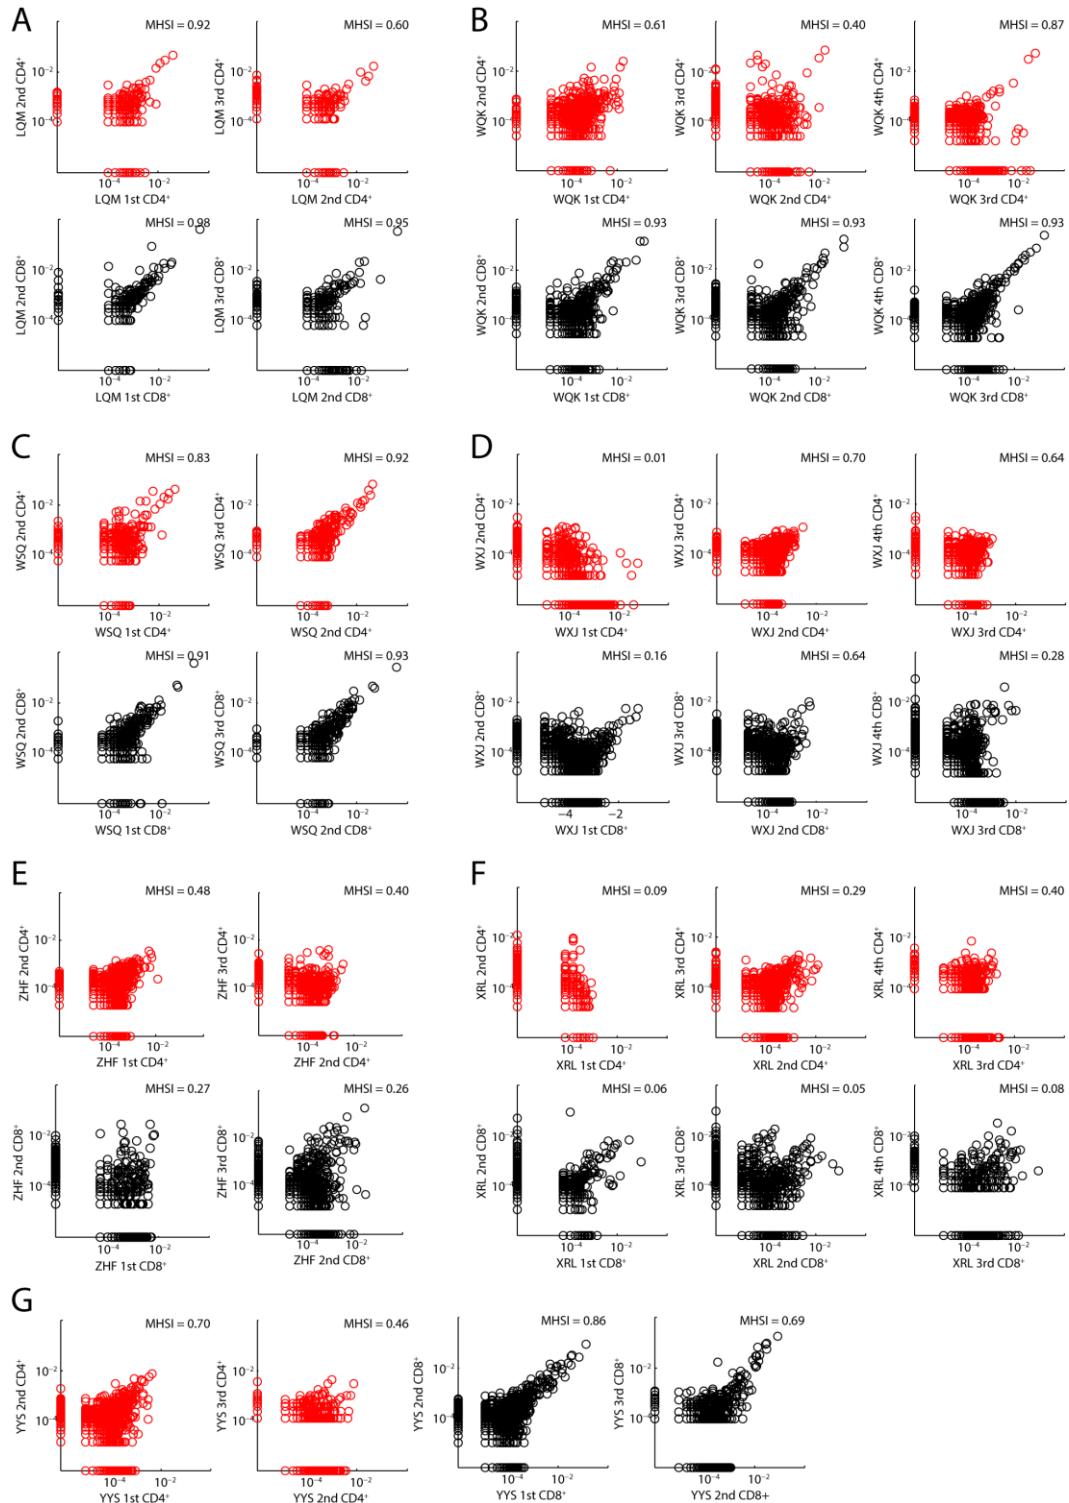

Figure-S5. Repertoire reformation during course of DRESS

Scatterplot showing the dynamic repertoire change for CD4⁺ (red dots) and CD8⁺ (black dots) T-cell clones. **(A-G)** Each dot represents a unique CDR3 AA clone and the corresponding abundance in 2 blood samples from adjacent time points. The dots on the axis indicate the clonotypes detected within a single repertoire. The MHSI is shown in the upper right corner for each panel.

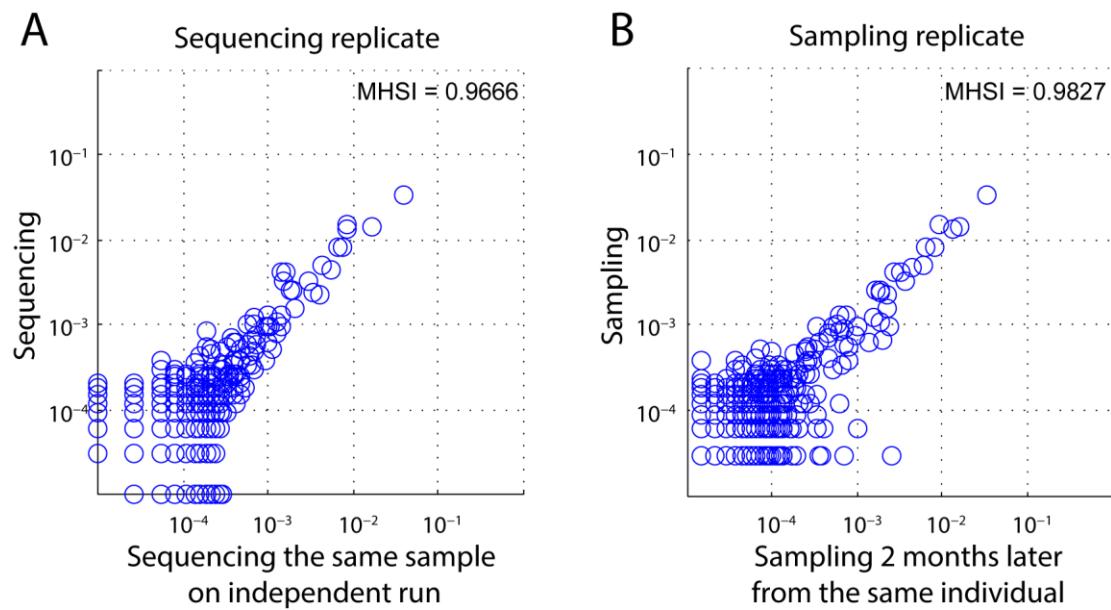

Figure-S6. Feasibility of sequencing strategy

Quality-control experiment to validate the reproducibility of our sequencing strategy. **(A)** Reproducibility of sequencing replicate. Peripheral blood mononuclear cells (PBMCs) were isolated from peripheral blood (10mL) obtained from a healthy donor for library construction. This library was sequenced twice independently to show the reproducibility of CDR3 AA clones. **(B)** Reproducibility of sampling replicates. PBMCs from an additional 10mL of peripheral blood were obtained from the same healthy donor at 57 days after the first sampling. The library was constructed and sequenced using the same protocol. The donor had no evidence of any immune-challenge, such as infections or medication, during this sampling interval. MHSI was calculated and shown in the upper right corner for each panel.

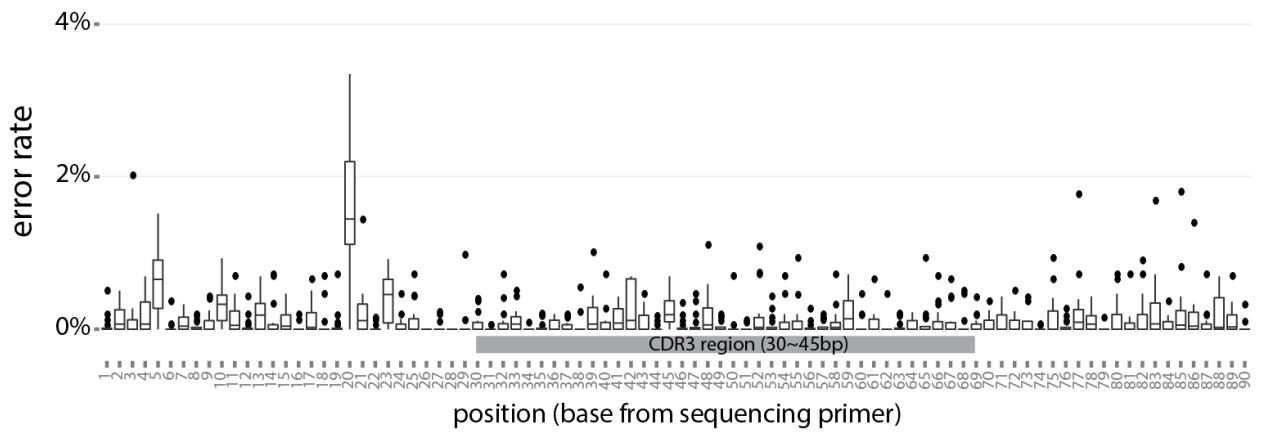

Figure-S7. Estimation of sequencing error rate

Error rate was estimated for sequencing reads covering the entire CDR3 region. 56 distinct PCR products were cloned into T-vector as standard template, and, sequenced independently according to identical protocol in this project. Box plot illustrated the distribution of error rate for each standard template in certain position. The overall error rate was 0.16% in the sequencing reads and 0.14% in CDR3 region.

Table-S1. Clinical and biological features of eight DRESS patients (at the time point of diagnosis).
