

Figure S8. Plasma ccfDNA amount.

(A) Box plots showing the amount of ccfDNA (ng/ml plasma, determined by using the Qubit HsDNA Kits) for HCC patients (P(HCC)), cirrhosis patients (P(Ci)) and normal individuals (P(N)). Two-tailed MWW test. The ccfDNA concentration in plasma ranged from 0.6 to 140 ng/ml plasma in HCC patients. **(B)** The ccfDNA amount is uncorrelated with the tumor size.
