Supplementary Table S7. Allele specific effects of the 9 genes identified by the single correlation method. SNPs nearest to these genes are listed. Each SNP was used to separate the 48 RIAILs into two groups of either carrying the HW or N2 allele of each gene. The difference in the average leaving rates between the two groups was examined by Student's t test (two tailed) and the P values of the test are shown.

Gene Name	Direction ¹	SNP	CHR ²	Distance ³	P value (T.TEST) ⁴
amx-2	-	CE1-209	I	20861	0.901094
K01A11.3	-	UCE2-1313	II	49455	0.483471

F37H8.3	+	UCE2-1985	II	77811	0.963926
Y44A6C.1	+	UCE5-3397	V	-62506	0.177455

¹Direction: Direction of correlation with both MAC and leaving rates. +, positive correlation; -, inverse correlation.

²Chr: Chromosome where the gene and SNP are located.

³ Distance without a '-' sign means that the SNP is located in front of the 5' end of the gene and the distance is between the SNP and first codon of the gene. Distance with a '-' sign means that the SNP is located at the 3' end of the gene and the distance is between the SNP and the stop codon of the gene.

⁴ The difference in the average leaving rate between N2 and HW allele groups was examined by Student's t test (two tailed) and the P values of the test are shown.
