

**Supplementary Table 1:** Clinical characteristics of AML patients tested in this study. Blue boxes indicate patients for whom extended mutational testing was performed. Pink boxes denote patients with relapsed or refractory disease. Purple boxes indicate patients who achieved CR after biopsy. Orange boxes indicate patients who were not treated or died during treatment. Green boxes denote patients alive at last follow-up. Yellow boxes indicate patients who were receiving hydroxyurea at the time of biopsy.

Patient	Sex	Age	Cytogenetics	Mutations	Status at Biopsy	CR	Treatment	Survival (d)	Blast %	HU
<b>Core Binding Factor AML</b>

CR7	F	80	del 13q	None	CRI	N/A	N/A	112	4%	No

Chemotherapy regimens as follows: 4+3, high dose cytarabine x 4 days plus idarubicin x 3 days; 7+3, standard dose cytarabine x 7 days plus idarubicin x 3 days; 7+3 (90), standard dose cytarabine x 7 days plus high-dose daunorubicin x 3days; 5+2, standard dose cytarabine x 5days plus idarubicin x 2 days; Aza + GO, azacitidine plus gemtuzumab; Arsenic + ATRA, arsenic trioxide plus all-trans retinoic acid; ATRA + Dauno, all-trans retinoic acid plus daunorubicin; MEC, mitoxantrone, etoposide and intermediate-dose cytarabine; G-CLAC, fligrastim, clofarabine and high-dose cytarabine; Ida + ATRA, idarubicin plus all-trans retinoic acid. Note: Samples AML6 and AML8 came from the same patient, all others samples were from separate patients. Samples in italics were not analyzed for in all experiments (APL1 was collected 3 hours after biopsy and could not be analyzed for cell cycle or signaling; AML33 was collected fresh, but IdU was not added so this sample could not be analyzed for cell cycle).

**Supplementary Table 2:** Antibodies used in this study. The staining panel (A, B, or both) is indicated for each. The “Analyses” column indicates whether the marker was used for each dimensionality reduction analysis (S, SPADE analysis; V, viSNE analysis; B, multidimensional binning). Coefficients of variation (CV) were calculated based on the average of gated cell populations with expression of the marker. CVs could not be calculated for two of the markers (“N/A”); cleaved PARP-positive cells were too rare to allow accurate estimation of the CV, and pSMAD1/5 did not have sufficiently bright staining to perform any analyses.

**Supplementary Table 3:** Comparison of clinical (fluorescent) flow cytometry (on left), to mass cytometry analysis (on right). Green boxes indicate results that were consistent between the techniques, orange boxes indicate results that were inconsistent. Not all results were reported in clinical flow cytometry pathology report and not all results could be compared (uncolored boxes). Partial expression (p) as indicated.
