

Supplemental Figure 5. Physiologic responses of BAPN exposed rats 24 hours prior to abdominal aortic aneurysm (AAA) rupture. (A) Mean heart rate (\pm SD) and (B) blood pressure (\pm SD) data over 24-hours prior to AAA rupture, for β -aminopropionitrile exposed (BAPN) rats (N=5). No significant changes in heart rate or blood pressure were noted over the 24 hour period prior to rupture. Mean arterial pressure (MAP).
