

High-density lipoprotein contribute to G0-G1/S transition in Swiss NIH/3T3 fibroblasts

Fabrizio Angius, Stefano Spolitu, Sabrina Uda, Stefania Deligia, Alessandra Frau, Sebastiano Banni, Maria Collu, Simonetta Accossu, Clelia Madeddu, Roberto Serpe, Barbara Batetta

Movie legends

Movie 1. Dil-HDL in quiescent NIH/3T3 fibroblasts.

Living contact-inhibited cells at the concentration of about 4.0×10^4 cells/cm² (stationary growth), were incubated for 1h at 4°C with Dil-HDL, then the cells were washed with PBS and the Dil fate has been followed for up to 1h at RT.

Movie 2. Dil-HDL in proliferating NIH/3T3 fibroblasts.

Cells were diluted at 1.5×10^4 cells/cm². After 24h culture (exponential growth) cells were incubated for 1h at 4°C with Dil-HDL, then the cells were washed with PBS and the Dil fate has been followed for up to 1h at RT.
