

PRDX6 controls multiple sclerosis by suppressing inflammation and blood brain barrier disruption

Supplementary Material

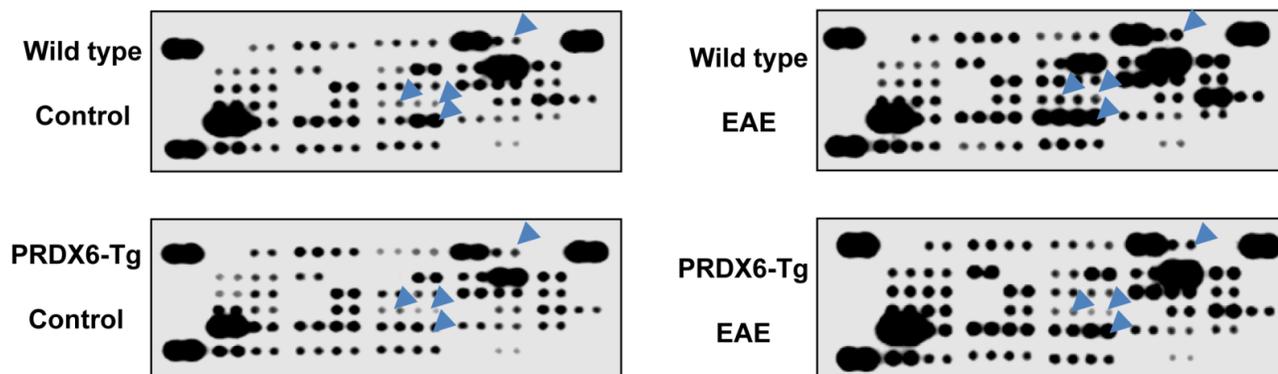

S_Figure 1. Expression of PRDX6 protein in mouse spinal cord. Images show hematoxylin and eosin (H&E) staining of mouse spinal cord (*left*). The spinal cord section was incubated with specific antibodies against PRDX6 protein and then were detected by immunohistochemistry (*right*).

S_Figure 2. Specific expression of PRDX6 on astrocytes in mouse spinal cord. (A) Immunofluorescence for PRDX6 (green) and MBP (red, oligodendrocyte marker), NeuN (red, neuron marker) or GFAP (red, astrocytes marker) was immunostained with rabbit anti-PRDX6 and mouse anti-MBP, -NeuN, or -GFAP antibodies in the mouse spinal cord, and then, sections were stained with DAPI (blue). (B) Magnified images show region containing dorsal and ventral column from immunofluorescence for PRDX6 and GFAP of A.
