General Information

Solvents were purchased from Aldrich or Acros and used without further purification. Other reagents were used as obtained from commercial providers except when otherwise noted. Analytical thin layer chromatography (TLC) was performed on pre-coated silica gel plates available from EMD. Visualization was accomplished with UV light. Column chromatography was performed using Biotage chromatographic systems. ^1H NMR and ^{13}C NMR spectra were recorded on Varian Inova instrument (400 MHz). Chemical shifts were quoted in parts per million (ppm) referenced to the residual undeuterated solvent peak or 0.0 ppm for tetramethylsilane. The following abbreviations were used to explain multiplicities: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet. Coupling constants, J , were reported in Hertz unit (Hz). Low and high resolution mass spectra were obtained using ESI methods.

General procedure for the preparation of compounds 3 and 5

In a 25 mL tube imidazo[1,2-a]pyridines (**1**, 1 mmol), and diethyl azodicarboxylate (DEAD, 2 mmol) were taken in 5 mL MeCN. The tube was sealed with a pressure cap and heated to 80 °C for 6 h. After cooling to room temperature, the mixture was diluted with ethyl acetate (20 mL) and washed with water, brine, and dried over anhydrous Na_2SO_4 . The organic solvent was removed under vacuum to get the crude product, which is purified using Biotage chromatographic systems.
