

## *Why carry out this study?*

- Many patients undergoing transcatheter aortic valve replacement (TAVR) have an indication for anticoagulation.
- The optimal antithrombotic strategy in these patients has not been well studied.
- Our study asks what is the current practice of antithrombotic therapy following TAVR at a single, large academic institution.

## *What was learned from the study?*

- Antithrombotic therapy following TAVR is highly variable.
- Almost two-thirds of patients after TAVR have an indication for anticoagulation.
- Most patients at our institution with an indication for anticoagulation are discharged on aspirin and warfarin.
