Note: Cortisol units are ln(mg/dL) for serum and ln(nmol/L) for all other variables; F2-Isoprostane units are ln(ng/mL); CI = Confidence Interval; * $p < 0.05$ (2-tailed); β values represent standardized units, whereas b values represent raw values.

Figure S1. Associations between composite weight stigma and outcome measures comparing the lowest quartile (<27.7) of BMI to all others. The association is similar between the two groups, consistent with the interpretation that weight stigma may even affect women who are nearer to what is considered "normal" BMI. Panel A. Weight stigma and morning serum cortisol. Panel B. Weight stigma and total diurnal cortisol AUC. Panel C. Weight stigma and cortisol awakening response. Panel D. Weight stigma and F2-isoprostanes.
