

**SUPPLEMENTARY FIGURE 13 | Influence of KCN on pollen germination.** Germination rates of WT pollen treated with KCN, normalized to the untreated control (= 100%). Error bars represent  $\pm$  SD of means from five experiments. For each experiment, germination of 100 – 300 pollen grains was evaluated in duplicates or triplicates. Asterisks indicate statistical significance calculated with the Student's *t* test (\*\* $P < 0.01$ ). Exact values are given in **Supplementary Table 5**.
